# Discrete approximation of dynamic phase-field fracture in visco-elastic materials 

Marita Thomas, Sven Tornquist

#### Abstract

This contribution deals with the analysis of models for phase-field fracture in visco-elastic materials with dynamic effects. The evolution of damage is handled in two different ways: As a viscous evolution with a quadratic dissipation potential and as a rate-independent law with a positively 1-homogeneous dissipation potential. Both evolution laws encode a non-smooth constraint that ensures the unidirectionality of damage, so that the material cannot heal. Suitable notions of solutions are introduced in both settings. Existence of solutions is obtained using a discrete approximation scheme both in space and time. Based on the convexity properties of the energy functional and on the regularity of the displacements thanks to their viscous evolution, also improved regularity results with respect to time are obtained for the internal variable: It is shown that the damage variable is continuous in time with values in the state space that guarantees finite values of the energy functional.

## 1 Introduction

This work is concerned with the evolution of dynamic fracture in a visco-elastically deformable solid body occupying a domain $\Omega \subset \mathbb{R}^{d}, 1<d \in \mathbb{N}$. The process is monitored within a time interval [ $\left.0, \mathrm{~T}\right]$. It is assumed that only sufficiently small external loadings are applied such that the setting of small strains is admissible. Here the displacement field $u$ : $[0, \mathrm{~T}] \times \Omega \rightarrow \mathbb{R}^{d}$ characterizes the elastic deformation of the fracturing solid and the linearized strain tensor $e(u):=$ $\frac{1}{2}\left(\nabla u+\nabla u^{\top}\right)$ is a feasible measure of strain. To enable the model to capture complicated crack geometries the approach of phase-field fracture is applied [FM98 BFM00, MHW10, HW14 AGDL15 KM10], in which the $(d-1)$-dimensional crack surface is approximated by a $d$-dimensional volume where damage of the material occurs. In the spirit of generalized standard materials [HN75] the volume damage of the material is modelled with the aid of an internal variable

$$
z:[0, \mathrm{~T}] \times \Omega \rightarrow[0,1]
$$

called here phase-field or damage variable, which accounts for the state of material degradation in each point of the domain $\Omega \subset \mathbb{R}^{d}$. By taking values in $[0,1], z$ represents in our notation the volume fraction of undamaged material, i.e., $z(t, x)=1$ if the material is completely sound and $z(t, x)=0$ in case of maximal damage in a material point $x \in \Omega$ at time $t \in[0, \mathrm{~T}]$. As it is the case for metals or rubber we assume that healing of the material cannot occur, so that damage increases over time and hence in our notation $z$ has to decrease in time. This unidirectional evolution is realized in the model by a non-smooth constraint, enforced by the characteristic function $\chi_{(-\infty, 0]}$ of the interval $(-\infty, 0]$, i.e.,

$$
\chi_{(-\infty, 0]}(v):=\left\{\begin{array}{cl}
0 & \text { if } v \in(-\infty, 0],  \tag{1}\\
\infty & \text { otherwise },
\end{array}\right.
$$

and the occurrence of this non-smooth function in the model turns the evolution law into a subdifferential inclusion, resp. variational inequality. In this work, we will study two different evolution laws for $z$ : A viscous law and a rate-independent law. On a formal level, the Cauchy problem for phase-field fracture in visco-elastic materials at small strains with a viscous evolution of damage is given as follows:

$$
\begin{array}{r}
\rho \ddot{u}-\operatorname{div}(\mathbb{D}(z) e(\dot{u})+\mathbb{C}(z) e(u))=f_{V} \text { in }(0, \mathrm{~T}) \times \Omega, \\
M \dot{z}+\partial \chi_{(-\infty, 0]}(\dot{z})+\frac{1}{2} \mathbb{C}^{\prime}(z) e(u): e(u)-\frac{1}{\ell}(1-z)-\ell \operatorname{div} \nabla z \ni 0 \text { in }(0, \mathrm{~T}) \times \Omega . \tag{2b}
\end{array}
$$

In 2a, $\rho>0$ is the mass density and $f_{V}:[0, \mathrm{~T}] \times \Omega \rightarrow \mathbb{R}^{d}$ denotes an external volume force. Moreover, in 2b the parameter $M>0$ is the viscosity parameter and $\ell>0$ controls the width of the diffusive crack zone. The evolution laws

2a and 2b are complemented by the boundary and initial conditions

$$
\begin{array}{lr}
u(t)=0 & \text { in }[0, \mathrm{~T}] \times \partial_{D} \Omega \\
(\mathbb{D}(z) e(\dot{u})+\mathbb{C}(z) e(u)) \mathrm{n}=f_{S} & \text { in }(0, \mathrm{~T}) \times \partial_{N} \Omega, \\
\ell \nabla z \cdot \mathrm{n}=0 & \text { in }(0, \mathrm{~T}) \times \partial \Omega, \\
u(0)=u_{0} & \text { in } \Omega, \\
\dot{u}(0)=\dot{u}_{0} & \text { in } \Omega, \\
z(0)=z_{0} & \text { in } \Omega, \tag{2h}
\end{array}
$$

where $u_{0}, \dot{u}_{0}, z_{0}$ are given initial data. The boundary of $\Omega$ is denoted by $\partial \Omega$ with outer unit normal n . On the Dirichlet boundary $\partial_{D} \Omega$ there are imposed homogeneous Dirichlet conditions at all times $t \in[0, \mathbf{T}]$, i.e., it is assumed that also $u_{0}=\dot{u}_{0}=0$ on $\partial_{D} \Omega$. On the Neumann boundary $\partial_{N} \Omega:=\partial \Omega \backslash \partial_{D} \Omega$ there acts an external surface force $f_{S}:[0, \mathrm{~T}] \times \partial_{N} \Omega \rightarrow \mathbb{R}^{d}$.

In addition to the viscous evolution of $z$ with $M>0$ in 2b, we will also consider the case of a rate-independent evolution $M=0$ in 2b. In particular, we will use a vanishing viscosity limit $M \rightarrow 0$ to prove the existence of solutions for the rate-independent setting. In order to better explain our methods and results we now define the function spaces

$$
\begin{align*}
\mathbf{Z} & :=L^{1}(\Omega), \quad \mathbf{Z}_{M}:=L^{2}(\Omega), \quad \mathbf{X}:=H^{1}(\Omega), \quad \mathbf{Y}:=H^{1}(\Omega) \cap L^{\infty}(\Omega)  \tag{3a}\\
\mathbf{U} & :=\left\{v \in H^{1}\left(\Omega, \mathbb{R}^{d}\right), v=0 \text { on } \partial_{D} \Omega\right\}, \quad \mathbf{W}:=L^{2}\left(\Omega ; \mathbb{R}^{d}\right) \tag{3b}
\end{align*}
$$

and introduce the functionals that lead to the evolution law 2. In particular, we define the viscous dissipation potential for the damage variable $\mathcal{R}_{M}: \mathbf{Z}_{M} \rightarrow[0, \infty]$,

$$
\begin{equation*}
\mathcal{R}_{M}(v)=\int_{\Omega} \mathrm{R}_{M}(v) \mathrm{d} x \text { with } \mathrm{R}_{M}(v):=\frac{M}{2}|v|^{2}+\chi_{(-\infty, 0]}(v) . \tag{4}
\end{equation*}
$$

The vanishing-viscosity limit $M \rightarrow 0$ results in the non-smooth, rate-independent potential $\mathcal{R}: \mathbf{Z} \rightarrow[0, \infty]$, which here only consists of the unidirectionality constraint,

$$
\begin{equation*}
\mathcal{R}(v):=\int_{\Omega} \chi_{(-\infty, 0]}(v) \mathrm{d} x \tag{5}
\end{equation*}
$$

At this point we observe that $\mathcal{R}$ indeed is positively homogeneous of degree 1 , since $\mathcal{R}(0)=0$ and $\mathcal{R}(\lambda v)=\lambda \mathcal{R}(v)$ is trivially satisfied for all $\lambda>0$ and $v \in \mathbf{Z}$.
In view of 2a) we also introduce the viscous dissipation potential of quadratic growth for the displacements $\mathcal{V}: \mathbf{X} \times \mathbf{U} \rightarrow$ $[0, \infty)$,

$$
\begin{equation*}
\mathcal{V}(z ; \dot{u}):=\int_{\Omega} \frac{1}{2} \mathbb{D}(z) e(\dot{u}): e(\dot{u}) \mathrm{d} x \tag{6}
\end{equation*}
$$

and the kinetic energy $\mathcal{K}: \mathbf{W} \rightarrow[0, \infty)$,

$$
\begin{equation*}
\mathcal{K}(\dot{u}):=\int_{\Omega} \frac{\rho}{2}|\dot{u}|^{2} \mathrm{~d} x . \tag{7}
\end{equation*}
$$

Moreover, the energy functional $\mathcal{E}:[0, T] \times \mathbf{U} \times \mathbf{X} \rightarrow \mathbb{R}$ associated with system 2 is given by

$$
\begin{equation*}
\mathcal{E}(t, u, z):=\int_{\Omega}\left(\frac{1}{2} \mathbb{C}(z) e(u): e(u)+\left(\frac{1}{2 \ell}(1-z)^{2}+\frac{\ell}{2}|\nabla z|^{2}\right)\right) \mathrm{d} x-\langle f(t), u\rangle_{\mathbf{U}^{*}, \mathbf{U}} \tag{8}
\end{equation*}
$$

where we have gathered the volume load $f_{V}$ from 2a and the surface load $f_{S}$ from 2d in the term

$$
\langle f(t), u\rangle_{\mathbf{U}^{*}, \mathbf{U}}:=\int_{\Omega} f_{V}(t) \cdot u \mathrm{~d} x+\int_{\partial_{N} \Omega} f_{S}(t) \cdot u \mathrm{~d} S
$$

the detailed assumptions on the external loadings are specified in 17. Note that $\mathcal{E}$ is a slight modification of the AmbrosioTortorelli functional for phase-field fracture as we will allow $\mathbb{C}$ to depend on $z$ in a monotone, but non-convex way to keep $\mathbb{C}$ bounded, cf. assumptions 13 \& 14 lateron. Moreover, we will assume both tensors $\mathbb{C}$ and $\mathbb{D}$ in 6 to be uniformly
positive definite for all $z \in \mathbb{R}$, so that the material can bear loads and still shows a visco-elastic response even in the state of maximal damage $z=0$. In this way, model 2] captures partial damage of the body, only. In the purely rate-independent case of quasistatic evolutions, i.e., in the setting of energetic solutions for rate-independent processes the systems given by $(\mathbf{U} \times \mathbf{Z}, \mathcal{E}, \mathcal{R})$ from (3), 5], and with an energy of the type (8), were shown in (Gia05) to approximate the Francfort-Marigo model for brittle fracture [FM98] as $\ell \rightarrow 0$. This model is a variational formulation of Griffith' energetic approach [Gri21] to the description of brittle crack growth in terms of competing elastic bulk and dissipative surface energies. Following Griffith' ideas for brittle solids, such as glass and certain metals, fracture is often modelled as a rate-independent process. This modelling approach captures the observation that cracks can form and evolve abruptly, much faster than the changes of the external loadings. In fact, solutions of purely rate-independent damage and fracture models do feature jumps with respect to time, cf. e.g., KS12 RTP15]. More recently, research focus in both engineering applications [BVS ${ }^{+}$12 SWKM14 SKM $^{+}$17 and in applied analysis [DMLT16 DMLT19, DMLT20 LRTT18 Rou19 RT17a SS19] is put on the investigation of dynamic fracture.

As an immediate approach based on well-established models for rate-independent phase-field fracture, the rate-independent evolution of the damage variable is coupled with a (visco-) dynamic evolution of the displacements as also done in 2. In order to achieve better stability in numerical simulations, often a viscosity for the damage variable is added to the model, as we also allow for in 2) if $M>0$. It is the aim of this contribution to better investigate the interplay of the rate-independent evolution of the damage variable with the visco-elastodynamic evolution of the displacements.

For this, we will now give a suitable weak formulation for system 2. In this setting, we will show the existence of solutions and study their temporal regularity for both cases $M>0$ and $M=0$.

Definition 1.1. In the spirit of [RT17a] we call a system that combines the conservative process of elastodynamics with further dissipative processes a damped inertial system. We denote the damped inertial system with viscous regularization $M>0$ for the damage variable from 2 by the tuple ( $\left.\mathbf{U}, \mathbf{W}, \mathbf{Z}_{M}, \mathcal{V}, \mathcal{K}, \mathcal{R}_{M}, \mathcal{E}\right)$. The damped inertial system obtained in the rate-independent limit $M \rightarrow 0$ is denoted by $(\mathbf{U}, \mathbf{W}, \mathbf{Z}, \mathcal{V}, \mathcal{K}, \mathcal{R}, \mathcal{E})$.

In the viscous case $M>0$ a suitable weak formulation for the damped inertial system ( $\left.\mathbf{U}, \mathbf{W}, \mathbf{Z}_{M}, \mathcal{V}, \mathcal{K}, \mathcal{R}_{M}, \mathcal{E}\right)$ is introduced as follows:
Definition 1.2 (Solutions of $\left(\mathbf{U}, \mathbf{W}, \mathbf{Z}_{M}, \mathcal{V}, \mathcal{K}, \mathcal{R}_{M}, \mathcal{E}\right)$, viscous case $M>0$ ). A pair $\left(u_{M}, z_{M}\right):[0, \mathbf{T}] \rightarrow \mathbf{U} \times \mathbf{X}$ is a solution of $\left(\mathbf{U}, \mathbf{W}, \mathbf{Z}_{M}, \mathcal{V}, \mathcal{K}, \mathcal{R}_{M}, \mathcal{E}\right)$ if it satisfies the following four conditions:

- one-sided variational inequality for $z_{M}$ for almost all $t \in[0, \mathrm{~T})$ :

$$
\begin{align*}
&\left.\int_{\Omega}\left[\frac{1}{2} \mathbb{C}^{\prime}\left(z_{M}(t)\right) e\left(u_{M}(t)\right): e\left(u_{M}(t)\right)-\frac{1}{\ell}\left(1-z_{M}(t)\right)\right)+M \dot{z}_{M}(t)\right] \eta \mathrm{d} x \\
&+\int_{\Omega} \ell \nabla z_{M}(t) \cdot \nabla \eta d x \geq 0 \tag{9a}
\end{align*}
$$

for all $\eta \in \mathbf{Y}$ such that $\eta \leq 0$ a.e. in $\Omega$;

- unidirectionality: for all $t_{1}<t_{2} \in[0, \mathrm{~T}]$ it is $z_{M}\left(t_{2}\right) \leq z_{M}\left(t_{1}\right)$ a.e. in $\Omega$;
- weak formulation of the momentum balance for all $t \in[0, \mathrm{~T}]$ :

$$
\begin{align*}
& \rho \int_{\Omega} \dot{u}_{M}(t) \cdot v(t) \mathrm{d} x-\rho \int_{0}^{t} \int_{\Omega} \dot{u}_{M}(r) \cdot \dot{v}(r) \mathrm{d} x \mathrm{~d} r \\
& \quad+\int_{0}^{t} \int_{\Omega}\left[\mathbb{D}\left(z_{M}\right) e\left(\dot{u}_{M}\right)+\mathbb{C}\left(z_{M}\right) e\left(u_{M}\right)\right]: e(v) \mathrm{d} x \mathrm{~d} r  \tag{9c}\\
& =\rho \int_{\Omega} \dot{u}_{M}(0) \cdot v(0) \mathrm{d} x+\int_{0}^{t}\langle f(r), v(r)\rangle_{\mathbf{U}^{*}, \mathbf{U}} \mathrm{~d} r \\
& \quad \text { for all } v \in L^{2}(0, \mathbf{T} ; \mathbf{U}) \cap H^{1}\left(0, \mathbf{T} ; L^{2}\left(\Omega, \mathbb{R}^{d}\right)\right) ;
\end{align*}
$$

- energy-dissipation balance for almost all $t \in[0, \mathrm{~T})$ :

$$
\begin{aligned}
& \mathcal{K}\left(\dot{u}_{M}(t)\right)+\mathcal{E}\left(t, u_{M}(t), z_{M}(t)\right)+\int_{0}^{t} 2\left(\mathcal{V}\left(z_{M} ; \dot{u}_{M}\right)+\mathcal{R}_{M}\left(\dot{z}_{M}\right)\right) \mathrm{d} r \\
& \quad=\mathcal{K}\left(\dot{u}_{0}\right)+\mathcal{E}\left(0, u_{0}, z_{0}\right)+\int_{0}^{t} \partial_{t} \mathcal{E}(r, u(r), z(r)) \mathrm{d} r .
\end{aligned}
$$

Above, in 9d the term $\partial_{t} \mathcal{E}(r, u(r), z(r))=-\langle\dot{f}(r), u(r)\rangle_{\mathbf{U}^{*}, \mathbf{U}}$ stands for the partial time-derivative of the energy functional. We point out that the formulation of the viscous damage evolution 9a) in terms of a one-sided variational inequality was already used in e.g. [HK11] at small strains and e.g. in [TBW20 TBW18] at finite strains. We also refer to the works HK11 BB08 RR15 HKRR17], where viscous damage models have been studied also in combination with dynamics and further dissipative effects such as heat transport and phase separation. Moreover, Rou19] gives a comprehensive overview on different time-discretization schemes for damage models with viscous evolution and dynamics.

In analogy to the above viscous case, a suitable notion of weak solution for the damped inertial system
$(\mathbf{U}, \mathbf{W}, \mathbf{Z}, \mathcal{V}, \mathcal{K}, \mathcal{R}, \mathcal{E})$ in the rate-independent case $M=0$ is given by:
Definition 1.3 (Solutions of $(\mathbf{U}, \mathbf{W}, \mathbf{Z}, \mathcal{V}, \mathcal{K}, \mathcal{R}, \mathcal{E})$, rate-independent case $M=0$ ). A pair $(u, z):[0, \mathbf{T}] \rightarrow \mathbf{U} \times \mathbf{X}$ is a solution of $(\mathbf{U}, \mathbf{W}, \mathbf{Z}, \mathcal{V}, \mathcal{K}, \mathcal{R}, \mathcal{E})$ if it satisfies the the following four conditions:

- one-sided variational inequality for $z$ for almost all $t \in[0, \mathrm{~T})$ :

$$
\begin{align*}
& \int_{\Omega}\left[\frac{1}{2} \mathbb{C}^{\prime}(z(t)) e(u(t)): e(u(t))-\frac{1}{\ell}(1-z(t))\right] \eta+\ell \nabla z(t) \cdot \nabla \eta d x \geq 0  \tag{10a}\\
& \text { for all } \eta \in \mathbf{Y} \text { such that } \eta \leq 0 \text { a.e. in } \Omega \tag{10b}
\end{align*}
$$

- unidirectionality: for all $t_{1}<t_{2} \in[0, \mathrm{~T}]$ it is $z\left(t_{2}\right) \leq z\left(t_{1}\right)$ a.e. in $\Omega$;
- weak formulation of the momentum balance for all $t \in[0, \mathrm{~T}]$ :

$$
\begin{align*}
& \rho \int_{\Omega} \dot{u}(t) \cdot v(t) \mathrm{d} x-\rho \int_{0}^{t} \int_{\Omega} \dot{u}(r) \cdot \dot{v}(r) \mathrm{d} x \mathrm{~d} r \\
& \quad+\int_{0}^{t} \int_{\Omega}[\mathbb{D}(z) e(\dot{u})+\mathbb{C}(z) e(u)]: e(v) \mathrm{d} x \mathrm{~d} r  \tag{10c}\\
& =\rho \int_{\Omega} \dot{u}(0) \cdot v(0) \mathrm{d} x+\int_{0}^{t}\langle f(r), v(r)\rangle_{\mathbf{U}^{*}, \mathbf{U}} \mathrm{~d} r \\
& \quad \text { for all } v \in L^{2}(0, \mathbf{T} ; \mathbf{U}) \cap H^{1}\left(0, \mathbf{T} ; L^{2}\left(\Omega, \mathbb{R}^{d}\right)\right)
\end{align*}
$$

$$
\text { nergy-dissipation balance for almost all } t \in[0, \mathrm{~T}) \text { : }
$$

$$
\begin{aligned}
& \mathcal{K}(\dot{u}(t))+\mathcal{E}(t, u(t), z(t))+\int_{0}^{t} 2 \mathcal{V}(z(r) ; \dot{u}(r)) \mathrm{d} r+\mathcal{R}(z(t)-z(0)) \\
& \quad=\frac{\rho}{2} \int_{\Omega}|\dot{u}(0)|^{2} \mathrm{~d} x+\mathcal{E}(0, u(0), s(0))+\int_{0}^{t} \partial_{t} \mathcal{E}(r, u(r), z(r)) \mathrm{d} r
\end{aligned}
$$

Remark 1.4 (Semistable energetic solution of $(\mathbf{U}, \mathbf{W}, \mathbf{Z}, \mathcal{V}, \mathcal{K}, \mathcal{R}, \mathcal{E})$ ). The tensorial map $z \mapsto \mathbb{C}(z)$ is assumed to be non-convex, but with a convexity regime $\left(-\infty, z_{*}\right)$ with $z_{*}>1$, such that $\mathbb{C}$ is convex in particular on the interval $[0,1]$, see assumptions 13 \& 14 for more details. Hence, the map $z \mapsto \mathcal{E}(t, u, z)$ is non-convex in general, but convex for functions $z \in \mathbf{X}$ that take values in $[0,1]$ a.e. in $\Omega$. In fact, for solutions $(u, z)$ in the sense of Def. 1.3 it will be shown in Theorem 5.1, and for the time-discrete version in Theorem 4.1 that $z:[0, \mathrm{~T}] \rightarrow \mathbf{X}$ takes its values in the interval $[0,1]$ a.e. in $\Omega$. Hence, convexity of $\mathcal{E}(t, u(t), \cdot)$ can be exploited along solutions. This is the reason why solutions of $(\mathbf{U}, \mathbf{W}, \mathbf{Z}, \mathcal{V}, \mathcal{K}, \mathcal{R}, \mathcal{E})$ in the sense of Definition 1.3 also fulfill the following semistability inequality for almost all $t \in[0, \mathrm{~T})$ :

$$
\begin{equation*}
\mathcal{E}(t, u(t), z(t)) \leq \mathcal{E}(t, u(t), \tilde{z})+\mathcal{R}(\tilde{z}-z(t)) \quad \text { for all } \tilde{z} \in \mathbf{X} \tag{11}
\end{equation*}
$$

with $\mathcal{E}$ from (8) and $\mathcal{R}$ from [5. Hence, solutions in the sense of Definition 1.3 are also semistable energetic solutions in the spirit of RT17a].

Remark 1.5 (Improved temporal regularity and 9d, 10, 11] for all $t \in[0, \mathrm{~T})$ ). Let $\mathrm{D}_{c}:=\{z \in \mathbf{Y}, 0 \leq z(x) \leq$ $z_{*}$ a.e. in $\left.\Omega\right\}$ denote the convexity regime of $\mathbb{C}$. Thanks to the observations for $\mathbb{C}$ discussed above in Remark 1.4 one finds for $\mathcal{E}$ from [8] that $\mathcal{E}(t, u(t), \cdot): \mathrm{D}_{c} \rightarrow \mathbb{R}$ is even uniformly convex in the following sense: There is a constant $C_{\star}>0$ such that for all $z_{0}, z_{1} \in \mathrm{D}_{c}$ and for all $\lambda \in[0,1]$ :

$$
\mathcal{E}\left(t, u(t), z_{\lambda}\right)+C_{\star} \lambda(1-\lambda)\left\|z_{1}-z_{0}\right\|_{\mathbf{X}}^{2} \leq \lambda \mathcal{E}\left(t, u(t), z_{1}\right)+(1-\lambda) \mathcal{E}\left(t, u(t), z_{0}\right),
$$

where we set $z_{\lambda}:=\lambda z_{1}+(1-\lambda) z_{0}$. This allows us to deduce improved regularity statements for the solution $z$ by suitably adapting a general regularity result from [RT17a, Thm. 3.8] for coupled rate-independent/rate-dependent systems. In the
rate-independent case $M=0$ we prove in Theorem 5.2 an abstract result providing a modulus of continuity to control the expression $\|z(t)-z(s)\|_{\mathbf{x}}$ at any times $s, t \in[0, \mathrm{~T}]$ in which the variational inequality 10a) and the energy-dissipation balance 10d are valid. In analogy, for the viscous case $M>0$ we deduce in Theorem 6.2 a modulus of continuity to control a kind of $\alpha$-variation $\sum_{k \in \mathbb{N}}\left\|z\left(t_{k}\right)-z\left(t_{k-1}\right)\right\|_{\mathbf{X}}^{\alpha}$ for partitions $\left(t_{k}\right)_{k \in \mathbb{N}}$ of any time interval $[s, t] \subset[0, \mathrm{~T}]$ with $s, t$ such that 9a] and the energy-dissipation balance 9d] are valid. In both cases, $M>0$ and $M=0$, the modulus of continuity emerges from terms related to the displacements and to their smoothness in time provided by the viscosity $\mathcal{V}$ from (6). Further exploiting the unidirectionality (10b), resp. 9b], of the damage evolution the modulus of continuity can be extended to any time $t \in[0, \mathrm{~T}$ ) in Corollary 5.5 for the rate-independent case $M=0$ and in Corollary 6.4 for the viscous case $M>0$. In this way, one ultimately finds that the map $z:[0, \mathrm{~T}) \rightarrow \mathbf{X}$ is continuous if $M>0$, cf. Theorem6.1 and even Hölder-continuous if $M=0$, cf. Theorem 5.1. Thus, in contrast to the purely rate-independent case, here in the coupled rate-independent/rate-dependent setting, the uniform convexity of $\mathcal{E}(t, u(t), \cdot): \mathrm{D}_{c} \rightarrow \mathbb{R}$ rules out that solutions $z$ have jumps in time, because the regularity of the displacements enhanced by the viscosity $\mathcal{V}$ also improves the temporal regularity of the internal variable $z$ to a continuous evolution in time with values in the state space $\mathbf{X}$.
Based on these continuity results, also properties 9d, 10] \& 11 can be concluded to hold for all $t \in[0, \mathrm{~T})$, cf. Corollaries 5.5 \& 6.4 for more details.

Outline of the paper. The purpose of this work is two-fold: On the one hand, as described in Remark 1.5 we investigate the influence of the coupling of the state variables on their temporal regularity. On the other hand we aim to bring the analytical approach closer to numerical methods. This is why we carry out the analysis for the existence of solutions in the sense of Definitions 1.2 and 1.3 for both systems $\left(\mathbf{U}, \mathbf{W}, \mathbf{Z}_{M}, \mathcal{V}, \mathcal{K}, \mathcal{R}_{M}, \mathcal{E}\right)$ and $(\mathbf{U}, \mathbf{W}, \mathbf{Z}, \mathcal{V}, \mathcal{K}, \mathcal{R}, \mathcal{E})$ based on a full discretization both in space and time. After specifying the basic assumptions on the domain and given data in Section 2 we introduce in Section 3 the discrete scheme based on a staggered time-discrete method in combination with a Galerkin approach in space, cf. 25], and we establish the existence of discrete solutions in Proposition 3.1 . In particular, as done for numerical simulations we understand on the discrete level the discretized version of $\left(\mathbf{U}, \mathbf{W}, \mathbf{Z}_{M}, \mathcal{V}, \mathcal{K}, \mathcal{R}_{M}, \mathcal{E}\right)$ as an approximation of the system. On the discrete level we also regularize the non-smooth unidirectionality constraint (1) with the aid of a Yosida approximation. While the fully discrete counterpart to 2a, reduces to solving a linear system of equations, it is more involved to find solutions for the discrete version of the damage evolution (2b) due to the nonlinearities stemming from the nonlinear $z$-dependence of the elastic tensor $\mathbb{C}$ and the Yosida term. The existence proof thus relies on arguments for nonlinear systems of equations based on Brouwer's fixed point theorem. We subsequently show that the discrete solutions obtained by the fully discrete scheme 25 approximate solutions of the systems ( $\mathbf{U}, \mathbf{W}, \mathbf{Z}_{M}, \mathcal{V}, \mathcal{K}, \mathcal{R}_{M}, \mathcal{E}$ ) and $(\mathbf{U}, \mathbf{W}, \mathbf{Z}, \mathcal{V}, \mathcal{K}, \mathcal{R}, \mathcal{E})$ in several steps: Based on uniform a-priori bounds in Prop. 3.2 being independent of the space-discretization we first pass to a space-continuous but time-discrete problem. In this setting it is possible to show that solutions satisfy the constraint $z \in[0,1]$ a.e. in $\Omega$ and hence lie in the convexity regime $\mathrm{D}_{c}$ of the energy functional. In this way one can obtain further uniform a priori bounds for the time-discrete solutions based on energy-dissipation estimates. Section 5 treats the limit passage from time-discrete to continuous in the case $M \rightarrow 0$ and thus provides the existence of solutions to system $(\mathbf{U}, \mathbf{W}, \mathbf{Z}, \mathcal{V}, \mathcal{K}, \mathcal{R}, \mathcal{E})$ in the sense of Def. 1.3 cf. Theorem 5.1 Subsequently, Section 6 is devoted to the viscous analogon with $M>0$ fixed and the existence of solutions to system ( $\mathbf{U}, \mathbf{W}, \mathbf{Z}_{M}, \mathcal{V}, \mathcal{K}, \mathcal{R}_{M}, \mathcal{E}$ ) in the sense of Def. 1.2 is obtained in Theorem6.1. The abstract results on the temporal regularity of the solutions addressed in Remark 1.5 are provided in Theorem 5.2 for the case $M=0$ and in Theorem 6.2 for the case $M>0$. We also point out that we obtain strong convergence of the discrete solutions thanks to the validity of the energy-dissipation balance 10d \& 9d, cf. Theorems 5.1\& 6.1
Comparison with other approaches in literature. For the limit passage from time-discrete to time-continuous in Sections 5 and 6 we adapt arguments from [RTT18], where the existence of semistable energetic solutions has been shown for a system coupling rate-independent damage processes in thermo-viscoelastic materials with dynamic effects. This concerns in particular the proofs of the weak balance of momentum and the energy-dissipation estimates, whereas the limit passage in the variational inequality for the damage evolution is different here due to the viscous regularization $M>0$. For simplicity, the present work only considers homogeneous Dirichlet conditions 2C and postulates $C^{1}$-regularity in time for the external load $f$, cf. [17. We refer to [LRTT18] for a relaxation to $H^{1}$-regularity in time and to [LRTT16] for the treatment of inhomogeneous, time-dependent Dirichlet conditions. We further point to the recent work [KZ19] which extends the existence theory for the purely rate-independent setting to discontinuous loads using Kurzweil integrals. We emphasize that our approach on the discrete level regularizes the unidirectionality constraint in terms of the Yosida approximation. There are other techniques to provide monotonicity of the damage evolution. In many applications the problem is solved as an unconstrained minimization and imposed a posteriori by a truncation with the solution from the previous time-step. In a
quasistatic $2 d$-setting with a viscous regularization for the damage variable it is shown in [ABN18] that discrete solutions obtained with this method by unconstrained minimization in an alternate minimization scheme and a posteriori truncation converge to solutions of a unilateral $L^{2}$-gradient flow.
We apply a vanishing viscosity method on the discrete level, but we do not develop balanced viscosity solutions in the sense of [MRS12 MRS08 EM06] for general rate-independent systems, or like in (KRZ13 KRZ15 KRZ19] in the context of quasistatic, rate-independent damage models. The main difficulty to apply this approach lies in the stored elastic energy $\int_{\Omega} \frac{1}{2} \mathbb{C}(z) e(u): e(u) \mathrm{d} x$ that nonlinearly couples the damage variable with the strains. Solutions $u$ for the displacement field, naturally found in the space $\mathbf{U} \subset H^{1}\left(\Omega ; \mathbb{R}^{d}\right)$, are not regular enough to make the variational derivative $\mathrm{D}_{z} \mathcal{E}(t, z, u)$ a well-defined object in the dual space $\mathbf{X}^{*}$ or in $\mathbf{Z}_{M}$ in general space dimension $d>2$, even if one finds $z$ being bounded with values in $[0,1]$ a.e. in $\Omega$. Due to this lack of regularity there is no chain rule available to calculate the time-derivative of the energy and hence, solutions cannot be a priori characterized in terms of an energy dissipation balance. In [KRZ13] or in [ABN18] in $2 d$ this issue is solved with the aid of an elliptic regularity result [HMW11 Theorem 1.1, p. 803] which provides sufficiently improved regularity for the displacements to find a chain rule. However, because of the rate-dependence of the displacements in problem (2) due to viscosity and inertia such improved spatial regularity results for the displacements are not available here.

## 2 Notation and basic assumptions

We denote by $\mathcal{L}^{m}$ the $m$-dimensional Lebesgue measure for any $m \in \mathbb{N}$.

Assumptions on the domain: For the domain $\Omega$ we make the assumptions

$$
\begin{align*}
& \Omega \subset \mathbb{R}^{d} \text { is a bounded domain with Lipschitz-boundary } \partial \Omega \text {, such that } \\
& \partial_{D} \Omega \subset \partial \Omega \text { is non-empty and relatively open and } \partial_{N} \Omega:=\partial \Omega \backslash \partial_{D} \Omega . \tag{12}
\end{align*}
$$

Assumptions on the tensors $\mathbb{C}, \mathbb{D}$ : The dependence of the material tensors $\mathbb{C}, \mathbb{D}: \mathbb{R} \rightarrow \mathbb{R}_{\text {sym }}^{d \times d \times d}$ on the phasefield parameter $z$ is realized by functions $w_{\mathbb{C}}, w_{\mathbb{D}}: \mathbb{R} \rightarrow\left[w_{0}, w^{*}\right]$ being prefactors to constant tensors $\tilde{\mathbb{C}}, \tilde{\mathbb{D}}$, i.e.,

$$
\begin{equation*}
\mathbb{C}(z):=w_{\mathbb{C}}(z) \tilde{\mathbb{C}} \quad \text { and } \quad \mathbb{D}(z):=w_{\mathbb{D}}(z) \tilde{\mathbb{D}} \text { for all } z \in \mathbb{R} \tag{13a}
\end{equation*}
$$

with constant, symmetric, and positively definite tensors $\widetilde{\mathbb{C}}, \tilde{\mathbb{D}}$.
For $w_{\mathbb{C}}, w_{\mathbb{D}}$ it is further assumed:

$$
\begin{align*}
& \text { - Differentiability \& boundedness: } w_{\mathbb{C}}, w_{\mathbb{D}} \in C^{1}\left(\mathbb{R},\left[w_{0}, w^{*}\right]\right)  \tag{14a}\\
& \text { with constants } 0<w_{0}<w^{*}, \\
& \text { - Monotonicity: } w_{\mathbb{C}}^{\prime}(z) \geq 0 \text { and } w_{\mathbb{D}}^{\prime}(z) \geq 0 \text { for all } z \in \mathbb{R},  \tag{14b}\\
& \text { - Locally constant growth: } w_{\mathbb{C}}^{\prime}(z)=0 \text { and } w_{\mathbb{D}}^{\prime}(z)=0 .  \tag{14c}\\
& \text { for all } z \in(-\infty, 0] \cup\left[z^{*}, \infty\right), \\
& \text { - Local convexity: There are } z_{*} \in\left(1, z^{*}\right) \text { and } w_{*} \in\left(w_{0}, w^{*}\right) \text { s.th. } \\
& \qquad w_{\mathbb{C}}:\left[0, z_{*}\right] \rightarrow\left[w_{0}, w_{*}\right] \text { is convex. } \tag{14d}
\end{align*}
$$

Remark 2.1 (Properties of $w_{\mathbb{C}}, w_{\mathbb{D}}$ and consequences). Properties 14 imply the existence of constants $0<c_{\mathbb{D}}^{0}<c_{\mathbb{D}}^{*}$ and $0<c_{\mathbb{C}}^{0}<c_{\mathbb{C}}^{*}$ such that for all $(z, A) \in \mathbb{R} \times \mathbb{R}^{d \times d}$ we have

$$
\begin{align*}
c_{\mathbb{D}}^{0}|A|^{2} & \leq \mathbb{D}(z) A: A \leq c_{\mathbb{D}}^{*}|A|^{2} \text { and }  \tag{15a}\\
c_{\mathbb{C}}^{0}|A|^{2} & \leq \mathbb{C}(z) A: A \leq c_{\mathbb{C}}^{*}|A|^{2} . \tag{15b}
\end{align*}
$$

Moreover, 14 implies that $w_{\mathbb{C}}$ qualitatively is of the form indicated in Fig. 7 .
The non-convexity of $w_{\mathbb{C}}$ on the interval $\left[z_{*}, z^{*}\right]$ entails that an upper energy-dissipation estimate alike 9d is not available for fully discrete solutions $\left(u_{\tau h}^{k}, z_{\tau h}^{k}\right)_{n}$. It will be only obtained in the limit $n \rightarrow \infty$ for the time-discrete, space-continuous solutions $\left(u_{\tau}^{k}, z_{\tau}^{k}\right)$, since it will be shown in Theorem 4.1. Formula 41 that $z_{\tau}^{k}$ takes values in $[0,1] \subset\left[z_{*}, z^{*}\right]$ a.e. in $\Omega$.

Figure 1: Qualitative shape of $w_{\mathbb{C}}: \mathbb{R} \rightarrow$ [ $\left.w_{0}, w^{*}\right]$ : The function is constant on the intervals $(-\infty, 0] \cup\left[z^{*}, \infty\right)$, monotonously increasing on $\mathbb{R}$, and convex on the interval $\left(-\infty, z_{*}\right)$ with $z_{*}>1$ but non-convex on $\left[z_{*}, z^{*}\right)$. The points $z_{\ominus} \ll 0$ and $z_{\oplus} \gg z^{*}$ will play a role later in the proof of Theorem 4.1 Formula 41, when showing that solutions $z_{\tau}^{k}$ of the spacecontinuous problem 2b are bounded in $[0,1]$.

Assumptions on the given data: We assume for the external volume force $f_{V}$ in 2a and the surface load $f_{S}$ in 2d that $f_{V} \in C^{1}\left(0, \mathrm{~T} ; \mathbf{U}^{*}\right)$ and $f_{S} \in C^{1}\left(0, \mathrm{~T} ; L^{2}\left(\partial_{N} \Omega, \mathbb{R}^{d}\right)\right)$. The combination of both forces

$$
\begin{equation*}
\langle f(t), v\rangle_{\mathbf{U}^{*}, \mathbf{U}}:=\left\langle f_{V}(t), v\right\rangle_{\mathbf{U}^{*}, \mathbf{U}}+\int_{\partial_{N} \Omega} f_{S}(t) \cdot v d \mathcal{H}^{d-1} \text { for all } v \in \mathbf{U} \tag{16}
\end{equation*}
$$

has the following properties:

- Regularity: $f \in C^{1}\left(0, T ; \mathbf{U}^{*}\right)$,
- Bounded time derivative: $\sup _{t \in[0, \mathrm{~T}]}\|\dot{f}(t)\|_{\mathbf{U}^{*}}<\infty$.

In addition, from the set of initial data in (2f-2h it is demanded that:

$$
\begin{align*}
& u_{0} \in \mathbf{U} \\
& \dot{u}_{0} \in \mathbf{U}  \tag{18}\\
& z_{0} \in \mathbf{X}, z_{0}(x) \in[0,1] \text { for almost all } x \in \Omega
\end{align*}
$$

Yosida-regularization: In the discrete setting, the non-smoothness in the dissipation potential $\mathcal{R}_{M}$ in 4 will be substituted by a smooth approximation in terms of the Yosida-regularization. For this, the characteristic function $\chi_{(-\infty, 0]}$ in (4) is replaced by

$$
\begin{equation*}
r \mapsto \frac{N_{\tau}}{2} m_{+}(r)^{2} \tag{19a}
\end{equation*}
$$

with $m_{+}: \mathbb{R} \rightarrow[0, \infty)$ the maximum function $m_{+}(r):=\max \{r, 0\}$ and $N_{\tau} \rightarrow \infty$ as time-step size $\tau \rightarrow 0$. Accordingly, $\mathrm{R}_{M}$ in (4) will be replaced in the discrete scheme by

$$
\begin{equation*}
\mathrm{R}_{M \tau}(v):=\frac{M}{2}|v|^{2}+\frac{N_{\tau}}{2} m_{+}(v)^{2} \tag{19b}
\end{equation*}
$$

and we write $\mathcal{R}_{M \tau}$ for the corresponding integral functional. For shorter notation in the proofs lateron, we will also write $m_{+}^{2}(r)$ for $m_{+}(r)^{2}$ in 19a. We point out that 19a) indeed is a regularization of the non-smooth unidirectionality constraint since

$$
\frac{\mathrm{d}}{\mathrm{~d} r} m_{+}^{2}(r)=\left\{\begin{array}{cl}
2 r & \text { if } r>0  \tag{2}\\
0 & \text { if } r \leq 0
\end{array}\right.
$$

## 3 Existence of fully discrete solutions

The strategy to find solutions for the systems $\left(\mathbf{U}, \mathbf{W}, \mathbf{Z}_{M}, \mathcal{V}, \mathcal{K}, \mathcal{R}_{M}, \mathcal{E}\right)$ and $(\mathbf{U}, \mathbf{W}, \mathbf{Z}, \mathcal{V}, \mathcal{K}, \mathcal{R}, \mathcal{E})$ is to consider a fully discrete scheme at first. The spatial discretization follows a Galerkin approach:
Space discretization: For $V \in\{\mathbf{X}, \mathbf{Y}, \mathbf{U}\}$ let $V_{n} \subset V, n \in \mathbb{N}$, be finite-dimensional subspaces such that these spaces form ascending chains, i.e. $V_{n_{1}} \subset V_{n_{2}}$, if $n_{1} \leq n_{2}$, and such that $\bigcup_{n>0} V_{n} \subset V$ densely. For $V_{n}=\mathbf{X}_{n}$ and $V_{n}=\mathbf{Y}_{n}$ the index $n \in \mathbb{N}$ coincides with the space dimension, while for $V_{n}=\mathbf{U}_{n}$ the space dimension is supposed to be $d n$, since elements $u \in \mathbf{U}_{n}$ are vector-valued functions of dimension $d$. Moreover, $P_{n}^{V}: V \rightarrow V_{n}$ denotes the projection onto $V_{n}$ defined by

$$
\begin{equation*}
\left\|P_{n}^{V}(v)-v\right\|_{V}=\min _{w \in V_{n}}\|w-v\|_{V} \quad \text { for all } v \in V . \tag{21}
\end{equation*}
$$

Let $\left(\varphi_{j}\right)_{j=1}^{n}$, resp. $\left(\varphi_{j}\right)_{j=1}^{d n}$, be a basis for $\mathbf{X}_{n}$, resp. $\mathbf{U}_{n}$. Then $z \in \mathbf{X}_{n}$ and $u \in \mathbf{U}_{n}$ are represented by $z=$ $\sum_{j=1}^{n} z_{j} \varphi_{j}, u=\sum_{j=1}^{d n} u_{j} \boldsymbol{\varphi}_{j}$ and we write $\mathbf{z}=\left(z_{j}\right)_{j=1}^{n} \in \mathbb{R}^{n}, \mathbf{u}=\left(u_{j}\right)_{j=1}^{d n} \in \mathbb{R}^{d n}$ for the vectors of coefficients.
Discretization in time: Consider a partition $\Pi_{\tau}=\left\{0=t_{\tau}^{0}<t_{\tau}^{1} \ldots<t_{\tau}^{N_{\tau}}=\mathrm{T}\right\}$ of the time interval $[0, \mathrm{~T}]$ with step size $\tau=t_{\tau}^{k}-t_{\tau}^{k-1}=\frac{\mathrm{T}}{N_{\tau}}$. For a sufficiently smooth function $v:[0, \mathrm{~T}] \rightarrow V$ we set $v_{\tau}^{k}=v\left(t_{\tau}^{k}\right)$ for $t_{\tau}^{k} \in \Pi_{\tau}$ and we introduce the discrete approximations of the time derivatives by

$$
\begin{align*}
\mathrm{D}_{\tau} v_{\tau}^{k} & :=\frac{v_{\tau}^{k}-v_{\tau}^{k-1}}{\tau},  \tag{22a}\\
\mathrm{D}_{\tau}^{2} v_{\tau}^{k} & :=\frac{1}{\tau}\left(\mathrm{D}_{\tau} v_{\tau}^{k}-\mathrm{D}_{\tau} v_{\tau}^{k-1}\right)=\frac{v_{\tau}^{k}-2 v_{\tau}^{k-1}+v_{\tau}^{k-2}}{\tau^{2}} . \tag{22b}
\end{align*}
$$

For the discretization of the external loadings we use an approximation

$$
\begin{equation*}
f_{\tau}^{k}:=f\left(t_{\tau}^{k}\right) \tag{23}
\end{equation*}
$$

and denote by $f_{\tau h}^{k}$ the restriction of $f_{\tau}^{k} \in \mathbf{U}^{*}$ to $\mathbf{U}_{h}$, where naturally

$$
\begin{equation*}
f_{\tau h}^{k} \rightarrow f_{\tau}^{k} \text { strongly in } \mathbf{U}^{*} \text { as } h \rightarrow \infty \text { for all } k \in\left\{1, \ldots, N_{\tau}\right\} \text { and } \tau>0 \text { fixed . } \tag{24}
\end{equation*}
$$

Discrete approximation of $\left(\mathbf{U}, \mathbf{W}, \mathbf{Z}_{M}, \mathcal{V}, \mathcal{K}, \mathcal{R}_{M}, \mathcal{E}\right)$ : Keep the time step-size $\tau>0$ fixed. For the initial data $\left(z_{0}, u_{0}, \dot{u}_{0}\right)$ from [18] set $z_{\tau}^{0}:=z_{0}, u_{\tau}^{0}:=u_{0}$, and $u_{\tau}^{-1}:=u_{0}-\tau \dot{u}_{0}$. For all $h \in \mathbb{N}$ let $\left(z_{\tau h}^{0}\right)_{h},\left(u_{\tau h}^{0}\right)_{h},\left(u_{\tau h}^{-1}\right)_{h}$ with $z_{\tau h}^{0} \in \mathbf{X}_{h}, u_{\tau h}^{0}, u_{\tau h}^{-1} \in \mathbf{U}_{h}$ be approximations of the inital data such that $z_{\tau h}^{0} \rightarrow z_{\tau}^{0}$ in $\mathbf{X}, u_{\tau h}^{0} \rightarrow u_{\tau}^{0}$ in $\mathbf{U}$, and $u_{\tau h}^{-1} \rightarrow u_{\tau}^{-1}$ in $\mathbf{U}$ as $h \rightarrow \infty$. For each $\tau, h>0$ fixed, using the discrete intial data $\left(z_{\tau h}^{0}, u_{\tau h}^{0}, u_{\tau h}^{-1}\right)$ our aim is to find for every time step $t_{\tau}^{k} \in \Pi_{\tau}$ solutions $z_{\tau h}^{k} \in \mathbf{X}_{h}, u_{\tau h}^{k} \in \mathbf{U}_{h}$ of the following staggered discrete Galerkin scheme:

$$
\begin{align*}
0= & \left\langle\mathrm{D}_{z} \mathcal{E}\left(t_{\tau}^{k}, u_{\tau h}^{k-1}, z_{\tau h}^{k}\right)+\mathrm{D} \mathcal{R}_{M \tau}\left(\mathrm{D}_{\tau} z_{\tau h}^{k}\right), \eta_{n}\right\rangle_{\mathbf{x}^{*}, \mathbf{x}} \text { for all } \eta_{n} \in \mathbf{Y}_{n}  \tag{25a}\\
0= & \int_{\Omega}\left(\mathrm{D}_{\tau}^{2} u_{\tau h}^{k} \cdot v_{n}+\left[\mathbb{D}\left(z_{\tau h}^{k}\right) e\left(\mathrm{D}_{\tau} u_{\tau h}^{k}\right)+\mathbb{C}\left(z_{\tau h}^{k}\right) e\left(u_{\tau h}^{k}\right)\right]: e\left(v_{n}\right)\right) \mathrm{d} x  \tag{25b}\\
& -\left\langle f_{\tau h}^{k}, v_{n}\right\rangle_{\mathbf{U}^{*}, \mathbf{U}} \text { for all } v_{n} \in \mathbf{U}_{n} .
\end{align*}
$$

We state the two results of this section, the existence of solutions $\left(u_{\tau h}^{k}, z_{\tau h}^{k}\right)$ for the Galerkin scheme 25 and their uniform boundedness with respect to the index $n \in \mathbb{N}$, cf. Propositions 3.1 and 3.2 the proofs will be carried out subsequently in Subsections 3.1 and 3.2

Proposition 3.1 (Existence of fully discrete solutions). Let the assumptions 12-19, be satisfied. Keep $\tau>0, k \in$ $\left\{1, \ldots, N_{\tau}\right\}$, and $n \in \mathbb{N}$ fixed. Then there exists a solution $\left(u_{\tau h}^{k}, z_{\tau h}^{k}\right)$ of the Galerkin scheme 25 corresponding to system $\left(\mathbf{U}, \mathbf{W}, \mathbf{Z}_{M}, \mathcal{V}, \mathcal{K}, \mathcal{R}_{M}, \mathcal{E}\right)$.

Note that, due to assumptions [13-14, the stored elastic energy is non-convex in $z$ on the subinterval $\left[z_{*}, z^{*}\right]$. Thus, one cannot expect to obtain an energy-dissipation estimate alike (9d] via convexity arguments. Nevertheless, thanks to assumptions 13b and 14b, the following uniform a-priori bounds can be obtained for fully discrete solutions $\left(u_{\tau h}^{k}, z_{\tau h}^{k}\right)_{n}$ for all $k$.

Proposition 3.2 (Uniform a-priori bounds for fully discrete solutions). Let the assumptions of Theorem 3.1 be fulfilled. Further assume that the discrete initial data $\left(u_{\tau h}^{0}\right)_{n},\left(u_{\tau h}^{-1}\right)_{n}$, and $\left(z_{\tau h}^{0}\right)_{n}$, are uniformly bounded. Then, the fully discrete solutions ( $u_{\tau h}^{k}, z_{\tau h}^{k}$ ) of problem 25) satisfy the following uniform a-priori bounds

$$
\begin{align*}
\left\|u_{\tau h}^{k}\right\|_{\mathbf{U}} & \leq \tilde{C}  \tag{26a}\\
\left\|z_{\tau h}^{k}\right\|_{\mathbf{z}} & \leq \tilde{C} \tag{26b}
\end{align*}
$$

with a constant $\tilde{C}=\tilde{C}\left(f, u_{0}, \dot{u}_{0}, z_{0}, \tau, M, \ell\right)$ depending on $f, u_{0}, \dot{u}_{0}, z_{0}, \tau, M$, $\ell$, but independent of $n \in \mathbb{N}$.

### 3.1 Proof of Proposition 3.1

In the following, $\tau>0$ and $k \in\left\{1, \ldots, N_{\tau}\right\}$ are kept fixed. Using the notation introduced at the beginning of Section 3 the Galerkin scheme 25 can be rewritten as a system of (non-) linear equations for the coefficient vectors $\mathbf{z}_{\tau h}^{k}=$ $\left(z_{\tau h i}^{k}\right)_{i=1}^{n} \in \mathbb{R}^{n}, \mathbf{u}_{\tau h}^{k} \in \mathbb{R}^{d h}$ :
Testing in 25b with basis elements $\varphi_{j}$ for $\mathbf{U}_{h}, j=1, \ldots, d n$, and multiplying with $\tau^{2}$ implies for all $j \in\{1, \ldots, d h\}$

$$
\begin{aligned}
0= & \sum_{i=1}^{d n} u_{\tau h i}^{k}\left(\int_{\Omega} \rho \boldsymbol{\varphi}_{i} \cdot \boldsymbol{\varphi}_{j} \mathrm{~d} x+\int_{\Omega}\left(\tau \mathbb{D}\left(z_{\tau h}^{k}\right)+\tau^{2} \mathbb{C}\left(z_{\tau h}^{k}\right)\right) e\left(\boldsymbol{\varphi}_{i}\right): e\left(\boldsymbol{\varphi}_{j}\right) \mathrm{d} x\right) \\
& +\int_{\Omega} \rho\left(-2 u_{\tau h}^{k-1}+u_{\tau h}^{k-2}\right) \cdot \boldsymbol{\varphi}_{j}-\tau \mathbb{D}\left(z_{\tau h}^{k}\right) e\left(u_{\tau h}^{k-1}\right): e\left(\boldsymbol{\varphi}_{j}\right) \mathrm{d} x-\tau^{2}\left\langle f_{\tau h}^{k}, \boldsymbol{\varphi}_{j}\right\rangle \mathbf{U}^{*}, \mathbf{U}
\end{aligned}
$$

This is rewritten as matrix-vector multiplication using the coefficient vector $\mathbf{u}_{\tau h}^{k}$ :

$$
\begin{align*}
& {\left[\int_{\Omega} \rho \boldsymbol{\varphi}_{i} \cdot \boldsymbol{\varphi}_{j} \mathrm{~d} x\right]_{i, j=1}^{d h} \mathbf{u}_{\tau h}^{k}+\left[\int_{\Omega}\left(\tau \mathbb{D}\left(z_{\tau h}^{k}\right)+\tau^{2} \mathbb{C}\left(z_{\tau h}^{k}\right)\right) e\left(\boldsymbol{\varphi}_{i}\right): e\left(\boldsymbol{\varphi}_{j}\right) \mathrm{d} x\right]_{i, j=1}^{d h} \mathbf{u}_{\tau h}^{k}}  \tag{27a}\\
& =\left[\int_{\Omega} \rho\left(2 u_{\tau h}^{k-1}-u_{\tau h}^{k-2}\right) \cdot \boldsymbol{\varphi}_{j}+\tau \mathbb{D}\left(z_{\tau h}^{k}\right) e\left(u_{\tau h}^{k-1}\right): e\left(\boldsymbol{\varphi}_{j}\right) \mathrm{d} x+\tau^{2}\left\langle f_{\tau h}^{k}, \boldsymbol{\varphi}_{j}\right\rangle \mathbf{U}^{*}, \mathbf{U}\right]_{j=1}^{d h}
\end{align*}
$$

which is a linear system of equations $\left(\mathbb{M}_{1}+\mathbb{M}_{2}\right) \mathbf{u}_{\tau h}^{k}=\mathbf{b}$. It is solvable since the mass matrices $\mathbb{M}_{1}$ and $\mathbb{M}_{2}$ are positively definite by the linear independence of the basis elements and thanks to the assumptions 13 on $\mathbb{C}, \mathbb{D}$. Thus, finding a solution $\mathbf{u}_{n}$ amounts to solving the linear system of equations 27a) by directly inverting the mass matrices.

Testing 25a with the basis elements $\varphi_{j}$ of $\mathbf{Z}_{h}, j=1, \ldots, n$, and using the notation $E:=\left(\varphi_{j}\right)_{j=1}^{n}$, leads to

$$
\begin{aligned}
\mathbf{0}= & \int_{\Omega}\left(\frac{1}{2} \mathbb{C}^{\prime}\left(z_{\tau h}^{k}\right) e\left(u_{\tau h}^{k-1}\right): e\left(u_{\tau h}^{k-1}\right)+\frac{N_{\tau}}{2} \frac{\mathrm{~d}}{\mathrm{~d} z} m_{+}^{2}\left(\mathrm{D}_{\tau} z_{\tau h}^{k}\right)\right) E \mathrm{~d} x \\
& +\left[\int_{\Omega}\left(\frac{M}{\tau}+\frac{1}{\ell}\right) \varphi_{i} \varphi_{j} \mathrm{~d} x\right]_{i, j=1}^{n} \mathbf{z}_{\tau h}^{k}+\left[\int_{\Omega} \ell \nabla \varphi_{i} \cdot \nabla \varphi_{j} \mathrm{~d} x\right]_{i, j=1}^{n} \mathbf{z}_{\tau h}^{k} \\
& -\int_{\Omega}\left(\frac{M}{\tau} z_{\tau h}^{k-1}+\frac{1}{\ell}\right) E \mathrm{~d} x
\end{aligned}
$$

which is a nonlinear system of equations

$$
\begin{equation*}
\mathbf{g}\left(\mathbf{z}_{\tau h}^{k}\right):=\mathbf{f}\left(\mathbf{z}_{\tau h}^{k}\right)+\mathbb{M}_{3} \mathbf{z}_{\tau h}^{k}+\mathbb{M}_{4} \mathbf{z}_{\tau h}^{k}-\mathbf{p}=\mathbf{0} \tag{27b}
\end{equation*}
$$

We show now that it posesses a solution for every fixed $k, \tau, h$. To do so, we will make use of the following result:
Proposition 3.3 ([Zei86] Prop. 2.8, p. 53]). Consider the system of equations

$$
\begin{equation*}
\mathbf{g}(\mathbf{z})=\left(g_{i}(\mathbf{z})\right)_{i=1}^{n}=\mathbf{0} \text { where } \mathbf{z} \in \mathbb{R}^{n} . \tag{28}
\end{equation*}
$$

Let $\bar{B}_{R}(0):=\left\{\mathbf{z} \in \mathbb{R}^{n},\|\mathbf{z}\| \leq R\right\}$ for fixed $R>0$ and $\|\cdot\|$ a norm on $\mathbb{R}^{n}$. Let $g_{i}: \bar{B}_{R}(0) \rightarrow \mathbb{R}$ be continuous for $i=1, \ldots, n$. Further assume that

$$
\begin{equation*}
\mathbf{g}(\mathbf{z}) \cdot \mathbf{z} \geq 0 \quad \text { for all } \mathbf{z} \text { with }\|\mathbf{z}\|=R \tag{29}
\end{equation*}
$$

Then (28) has a solution $\mathbf{z}$ with $\|\mathbf{z}\| \leq R$.

In the following we thus verify that the nonlinear system 27b satisfies the assumptions of Prop. 3.3. Here, we write $z=\sum_{i=1}^{n} z_{i} \varphi_{i}$ and $\mathbf{z}=\left(z_{i}\right)_{i=1}^{n}$. The continuity of $\mathbf{g}: \mathbb{R}^{n} \rightarrow \mathbb{R}^{n}$ follows by the assumptions of Section 2 It remains to check condition 29. For that, exploiting the positive definiteness of $\mathbb{M}_{3}$ and $\mathbb{M}_{4}$ one directly estimates

$$
\begin{equation*}
\mathbf{g}(\mathbf{z}) \cdot \mathbf{z}=\mathbf{f}(\mathbf{z}) \cdot \mathbf{z}+\mathbb{M}_{3} \mathbf{z} \cdot \mathbf{z}+\mathbb{M}_{4} \mathbf{z} \cdot \mathbf{z}-\mathbf{p} \cdot \mathbf{z} \geq \mathbf{f}(\mathbf{z}) \cdot \mathbf{z}+c_{1}|\mathbf{z}|^{2}-c_{2}|\mathbf{z}| \tag{30}
\end{equation*}
$$

where the constant $c_{1}=c_{1}\left(\frac{M}{\tau}, \ell\right)$ is given by the smallest eigenvalue of $\left(\mathbb{M}_{3}+\mathbb{M}_{4}\right)$ and $c_{2}=c_{2}\left(\frac{M}{\tau}, \frac{1}{\ell}, z_{\tau h}^{k-1}\right)$ originates from the term $\mathbf{p}=\int_{\Omega}\left(\frac{M}{\tau} z_{\tau h}^{k-1}+\frac{1}{\ell}\right) E \mathrm{~d} x$. We now estimate in detail the nonlinear term $\mathbf{f}(\mathbf{z}) \cdot \mathbf{z}$ that involves the nonlinear functions $\mathbb{C}^{\prime}$ and $\frac{\mathrm{d}}{\mathrm{d} z} m_{+}^{2}$. For these terms we use that $\mathbb{C}^{\prime}$ takes its maximum value at $z_{*}$ by 14 and that in view of 20

$$
\begin{equation*}
\frac{\mathrm{d}}{\mathrm{~d} z} m_{+}^{2}\left(\frac{1}{\tau}\left(z-z_{\tau h}^{k-1}\right)\right) E \cdot \mathbf{z} \geq-\frac{2}{\tau}\left(\left(1-\frac{1}{2 \varepsilon}\right)|\mathbf{z}|^{2}+\frac{\varepsilon}{2}\left|z_{\tau h}^{k-1}\right|^{2}\right) \tag{31}
\end{equation*}
$$

with $\varepsilon>0$ fixed but arbitrary such that $\left(1-\frac{1}{2 \varepsilon}\right)>0$. In this way we find

$$
\begin{aligned}
\mathbf{f}(\mathbf{z}) \cdot \mathbf{z} & =\int_{\Omega} \frac{1}{2} \mathbb{C}^{\prime}(z) e\left(u_{\tau h}^{k-1}\right): e\left(u_{\tau h}^{k-1}\right) E \cdot \mathbf{z} \mathrm{~d} x+\int_{\Omega} \frac{N_{\tau}}{2} \frac{\mathrm{~d}}{\mathrm{~d} z} m_{+}^{2}\left(\frac{1}{\tau}\left(z-z_{\tau h}^{k-1}\right)\right) E \cdot \mathbf{z} \mathrm{~d} x \\
& \geq-\int_{\Omega} \frac{1}{2}\left|\mathbb{C}^{\prime}\left(z_{*}\right)\right|\left|e\left(u_{\tau h}^{k-1}\right)\right|^{2}|\mathbf{z}| \mathrm{d} x-\int_{\Omega} \frac{N_{\tau}}{\tau}\left(\left(1-\frac{1}{2 \varepsilon}\right)|\mathbf{z}|^{2}+\varepsilon \frac{\left|z_{\tau h}^{k-1}\right|^{2}}{2}\right) \mathrm{d} x \\
& \geq-c_{3}|\mathbf{z}|-\frac{N_{\tau}}{\tau}\left(1-\frac{1}{2 \varepsilon}\right)|\mathbf{z}|^{2} \mathcal{L}^{d}(\Omega)-\int_{\Omega} \varepsilon \frac{N_{\tau}}{2 \tau}\left|z_{\tau h}^{k-1}\right|^{2} \mathrm{~d} x
\end{aligned}
$$

with $c_{3}=c_{3}\left(u_{\tau h}^{k-1}\right)$. Now, choose $\varepsilon>0$ such that with $c_{1}$ from $30 c_{4}:=c_{1}-\frac{N_{\tau}}{\tau}\left(1-\frac{1}{2 \varepsilon}\right) \mathcal{L}^{d}(\Omega)>0$. Then, with Young's inequality it follows that

$$
c_{4}|\mathbf{z}|^{2}-\left(c_{2}+c_{3}\right)|\mathbf{z}| \geq c_{4} \frac{|\mathbf{z}|^{2}}{2}-\frac{\left(c_{2}+c_{3}\right)^{2}}{c_{4}}
$$

Putting everything together and inserting it into 30 results in

$$
\begin{equation*}
\mathbf{g}(\mathbf{z}) \cdot \mathbf{z} \geq \frac{c_{4}}{2}|\mathbf{z}|^{2}-\frac{\left(c_{2}+c_{3}\right)^{2}}{c_{4}}-c_{5} \tag{32}
\end{equation*}
$$

with $c_{5}=c_{5}\left(\tau, z_{\tau h}^{k-1}\right)$, more precisely

$$
c_{5}=\varepsilon \frac{N_{\tau}}{2 \tau} \int_{\Omega}\left|z_{\tau h}^{k-1}\right|^{2} \mathrm{~d} x
$$

and $\varepsilon$ with the specific choice from above. From this we see that 29 is satisfied for $R \geq \sqrt{\frac{2 c_{5}}{c_{4}}+\frac{2\left(c_{2}+c_{3}\right)^{2}}{c_{4}^{2}}}$.

### 3.2 Proof of Proposition 3.2

We proceed by induction and see that the assertion is satisfied for the initial step $k=0$ thanks to the assumptions made on the initial data. For any step $k \in \mathbb{N}$, suppose that $\left(u_{\tau h}^{k-1}\right)_{n},\left(u_{\tau h}^{k-2}\right)_{n}$ and $\left(z_{\tau h}^{k-1}\right)_{n}$ are uniformly bounded in their
respective state spaces. Testing 25a, 25b] with the solutions $z_{\tau h}^{k}$ and $u_{\tau h}^{k}$ respectively, we estimate

$$
\begin{align*}
0= & \left\langle\mathrm{D}_{z} \mathcal{E}\left(t_{\tau}^{k}, u_{\tau h}^{k-1}, z_{\tau h}^{k}\right)+\mathrm{D} \mathcal{R}_{M \tau}\left(\mathrm{D}_{\tau} z_{\tau h}^{k}\right), z_{\tau h}^{k}\right\rangle_{\mathbf{x}^{*}, \mathbf{X}} \\
& +\int_{\Omega} \rho \mathbf{D}_{\tau}^{2} u_{\tau h}^{k} \cdot u_{\tau h}^{k}+\left[\mathbb{D}\left(z_{\tau h}^{k}\right) e\left(\mathrm{D}_{\tau} u_{\tau h}^{k}\right)+\mathbb{C}\left(z_{\tau h}^{k}\right) e\left(u_{\tau h}^{k}\right)\right]: e\left(u_{\tau h}^{k}\right) \mathrm{d} x \\
& -\left\langle f_{\tau h}^{k}, u_{\tau h}^{k}\right\rangle_{\mathbf{U}^{*}, \mathbf{U}} \\
\geq & \int_{\Omega} \frac{1}{2} z_{\tau h}^{k} \mathbb{C}^{\prime}\left(z_{\tau h}^{k}\right) e\left(u_{\tau h}^{k-1}\right): e\left(u_{\tau h}^{k-1}\right)-\frac{1}{\ell}\left(1-z_{\tau h}^{k}\right) z_{\tau h}^{k}+\ell\left|\nabla z_{\tau h}^{k}\right|^{2} \mathrm{~d} x \\
& +\int_{\Omega} M\left(\mathrm{D}_{\tau} z_{\tau h}^{k}\right) z_{\tau h}^{k}+\frac{N_{\tau}}{2} \frac{\mathrm{~d}}{\mathrm{~d} z} m_{+}^{2}\left(\mathrm{D}_{\tau} z_{\tau h}^{k}\right) z_{\tau h}^{k} \mathrm{~d} x  \tag{33}\\
& +\int_{\Omega} \frac{\rho}{\tau^{2}}\left(\left|u_{\tau h}^{k}\right|^{2}-\frac{1}{2}\left|u_{\tau h}^{k}\right|^{2}-2\left|u_{\tau h}^{k-1}\right|^{2}-\frac{1}{2}\left|u_{\tau h}^{k}\right|^{2}-\frac{1}{2}\left|u_{\tau h}^{k-2}\right|^{2}\right) \mathrm{d} x \\
& +\int_{\Omega} \frac{1}{\tau}\left(c_{\mathbb{D}}^{0}\left|e\left(u_{\tau h}^{k}\right)\right|^{2}-\frac{c_{\mathbb{D}}^{0}}{2}\left|e\left(u_{\tau h}^{k}\right)\right|^{2}-\frac{c_{\mathbb{D}}^{* 2}}{2 c_{\mathbb{D}}^{0}}\left|e\left(u_{\tau h}^{k-1}\right)\right|^{2}\right) \mathrm{d} x \\
& +\int_{\Omega} c_{\mathbb{C}}^{0}\left|e\left(u_{\tau h}^{k}\right)\right|^{2} \mathrm{~d} x-\left\|f_{\tau h}^{k}\right\|_{\mathbf{U}^{*}}\left\|u_{\tau h}^{k}\right\|_{\mathbf{U}},
\end{align*}
$$

where Hölder's and Young's inequalities where used to estimate the momentum term. Observe that the first term on the right-hand side is non-negative since $z_{\tau h}^{k} \mathbb{C}^{\prime}\left(z_{\tau h}^{k}\right) \geq 0$ by assumptions 14b] and 14d; it thus can be omitted to further estimate from below. For the phase-field term we estimate

$$
\begin{equation*}
\int_{\Omega} \frac{1}{\ell}\left(1-z_{\tau h}^{k}\right) z_{\tau h}^{k} \mathrm{~d} x \geq \frac{1}{2 \ell}\left\|z_{\tau h}^{k}\right\|_{L^{2}(\Omega)}^{2}-\frac{1}{2 \ell} \mathcal{L}^{d}(\Omega) \tag{34}
\end{equation*}
$$

and for the viscous dissipation we find the lower bound

$$
\begin{align*}
& \int_{\Omega} M\left(\mathrm{D}_{\tau} z_{\tau h}^{k}\right) z_{\tau h}^{k}+\frac{N_{\tau}}{2} \frac{\mathrm{~d}}{\mathrm{~d} z} m_{+}^{2}\left(\mathrm{D}_{\tau} z_{\tau h}^{k}\right) z_{\tau h}^{k} \mathrm{~d} x  \tag{35}\\
& \geq\left(\frac{M}{2 \tau}-\frac{N_{\tau}}{\tau}\left(1-\frac{1}{2 \varepsilon}\right)\right)\left\|z_{\tau h}^{k}\right\|_{L^{2}(\Omega)}^{2}-\frac{M}{2 \tau}\left\|z_{\tau h}^{k-1}\right\|_{L^{2}(\Omega)}^{2}-\frac{\varepsilon N_{\tau}}{2 \tau}\left\|z_{\tau h}^{k-1}\right\|_{L^{2}(\Omega)}^{2},
\end{align*}
$$

where again the lower bound on the Yosida-term in (31 was used and $\varepsilon>0$ was chosen such that $c_{6}=c_{6}(M, \tau):=$ $\left(\frac{M}{2 \tau}-\frac{N_{\tau}}{\tau}\left(1-\frac{1}{2 \varepsilon}\right)\right)>0$. We set $c_{7}=c_{7}\left(\frac{1}{\tau^{2}}\right):=\frac{\varepsilon N_{\tau}}{2 \tau}$ with $\varepsilon$ as above. The terms in the last line of 33 are estimated by Korn's inequality with constant $c_{K}$ and by Young's inequality

$$
\begin{equation*}
\int_{\Omega} c_{\mathbb{C}}^{0}\left|e\left(u_{\tau h}^{k}\right)\right|^{2} \mathrm{~d} x-\left\|f_{\tau h}^{k}\right\|_{\mathbf{U}^{*}}\left\|u_{\tau h}^{k}\right\|_{\mathbf{U}} \geq\left(\frac{c_{\mathrm{C}}^{0}}{c_{K}^{2}}-\frac{\delta}{2}\right)\left\|u_{\tau h}^{k}\right\|_{\mathbf{U}}^{2}-\frac{1}{2 \delta}\left\|f_{\tau h}^{k}\right\|_{\mathbf{U}^{*}}^{2}, \tag{36}
\end{equation*}
$$

where $\delta:=\frac{c_{c}^{0}}{c_{K}^{2}}$ is chosen such that $\left(\frac{c_{c}^{0}}{c_{K}^{2}}-\frac{\delta}{2}\right)=\frac{c_{C}^{0}}{2 c_{K}^{2}}$. Using estimates 34-36 in 33 and putting all negative terms to the left-hand side results in

$$
\begin{aligned}
& \frac{1}{2 \ell} \mathcal{L}^{d}(\Omega)+\frac{c_{K}^{2}}{2 c_{\mathbb{C}}^{0}}\left\|f_{\tau h}^{k}\right\|_{\mathbf{U}^{*}}^{2}+\frac{\rho}{\tau^{2}}\left(2\left\|u_{\tau h}^{k-1}\right\|_{L^{2}}^{2}+\frac{1}{2}\left\|u_{\tau h}^{k-2}\right\|_{L^{2}}^{2}\right) \\
& \quad+\left(\frac{M}{2 \tau}+c_{7}\right)\left\|z_{\tau h}^{k-1}\right\|_{L^{2}(\Omega)}^{2}+\frac{c_{\mathbb{D}}^{* 2}}{2 \tau c_{\mathbb{D}}^{0}}\left\|e\left(u_{\tau h}^{k-1}\right)\right\|_{L^{2}(\Omega)}^{2} \\
& \geq\left(c_{6}+\frac{1}{2 \ell}\right)\left\|z_{\tau h}^{k}\right\|_{L^{2}(\Omega)}^{2}+\ell\left\|\nabla z_{\tau h}^{k}\right\|_{L^{2}(\Omega)}^{2}+\frac{c_{\mathbb{C}}^{0}}{2 c_{K}^{2}}\left\|u_{\tau h}^{k}\right\|_{\mathbf{U}}^{2} .
\end{aligned}
$$

Since $\left\|f_{\tau h}^{k}\right\|_{\mathbf{U}^{*}} \leq C$ uniformly for all $k, \tau, n$ the above estimate gives a bound on $\left(z_{\tau h}^{k}\right)_{n}$ and $\left(u_{\tau h}^{k}\right)_{n}$ in $\mathbf{Z}$ and $\mathbf{U}$ uniformly for all $n \in \mathbb{N}$ and fixed $\tau, k \in \mathbb{N}$, i.e., with a constant $\tilde{C}=\tilde{C}\left(f, u_{0}, \dot{u}_{0}, z_{0}, \tau, M, \ell\right)$ as indicated in 26.

## 4 Limit passage from the space-discrete to the space-continuous setting

In this section we keep the parameters $M, \tau>0$ fixed and pass to the limit $n \rightarrow \infty$ with the space discretization. In particular, we obtain the following result:

Theorem 4.1 (Existence of solutions in the space-continuous setting). Let the assumptions of Proposition 3.1 and 3.2 be satisfied. For all $\tau>0, k \in\left\{0,1, \ldots, N_{\tau}\right\}, n \in \mathbb{N}$ let $\left(u_{\tau h}^{k}, z_{\tau h}^{k}\right)$ be a solution of 25. Keep $\tau>0$ fixed. Then the following statements hold true:

1 For each $k \in\left\{1, \ldots, N_{\tau}\right\}$ there is a (not relabelled) subsequence $\left(u_{\tau h}^{k}, z_{\tau h}^{k}\right)_{n}$ and a limit pair $\left(u_{\tau}^{k}, z_{\tau}^{k}\right) \in \mathbf{U} \times \mathbf{X}$ such that the following convergence results hold true:

$$
\begin{array}{ll}
u_{\tau h}^{k} \rightharpoonup u_{\tau}^{k} & \text { weakly in } \mathbf{U} \\
z_{\tau h}^{k} \rightharpoonup z_{\tau}^{k} & \text { weakly in } \mathbf{X} . \tag{37b}
\end{array}
$$

2 For each $k \in\left\{1, \ldots, N_{\tau}\right\}$ the limit pair $\left(u_{\tau}^{k}, z_{\tau}^{k}\right) \in \mathbf{U} \times \mathbf{X}$ is a solution of the time-discrete problem

$$
\begin{align*}
& 0=\left\langle\mathrm{D}_{z} \mathcal{E}\left(t_{\tau}^{k}, u_{\tau}^{k-1}, z_{\tau}^{k}\right)+\mathrm{D} \mathcal{R}_{M \tau}\left(\mathrm{D}_{\tau} z_{\tau}^{k}\right), \eta\right\rangle \mathbf{x}^{*}, \mathbf{x} \text { for all } \eta \in \mathbf{Y},  \tag{38a}\\
& 0=\int_{\Omega}\left(\mathrm{D}_{\tau}^{2} u_{\tau}^{k} \cdot v+\left[\mathbb{D}\left(z_{\tau}^{k}\right) e\left(\mathrm{D}_{\tau} u_{\tau}^{k}\right)+\mathbb{C}\left(z_{\tau}^{k}\right) e\left(u_{\tau}^{k}\right)\right]: e(v)\right) \mathrm{d} x-\left\langle f_{\tau}^{k}, v\right\rangle_{\mathbf{U}^{*}, \mathbf{U}}  \tag{38b}\\
& \text { for all } v \in \mathbf{U} .
\end{align*}
$$

3 Assume that the discrete initial data satisfy

$$
\begin{align*}
& u_{\tau h}^{0} \rightarrow u_{\tau}^{0} \text { in } \mathbf{U} \text { and } u_{\tau h}^{-1} \rightarrow u_{\tau}^{-1} \text { in } \mathbf{U},  \tag{39a}\\
& z_{\tau h}^{0} \rightarrow z_{\tau}^{0} \text { in } \mathbf{X} . \tag{39b}
\end{align*}
$$

Then, in addition to (37) for each $k \in\left\{1, \ldots, N_{\tau}\right\}$ also the following improved convergence results hold true:

$$
\begin{array}{cl}
u_{\tau h}^{k} \rightarrow u_{\tau}^{k} & \text { strongly in } \mathbf{U}, \\
z_{\tau h}^{k} \rightarrow z_{\tau}^{k} & \text { strongly in } \mathbf{X} . \tag{40b}
\end{array}
$$

4 Suppose that $z_{\tau h}^{0} \in[0,1]$. Then, for each $k \in\left\{1, \ldots, N_{\tau}\right\}$ the limit function $z_{\tau}^{k}$ satisfies

$$
\begin{equation*}
z_{\tau}^{k} \in \mathbf{Y}, \quad \text { in particular } 0 \leq z_{\tau}^{k} \leq 1 \text { a.e. in } \Omega . \tag{41}
\end{equation*}
$$

5 Let $L \in\left\{1, \ldots, N_{\tau}\right\}$. The time-discrete solutions $\left(u_{\tau}^{k}, z_{\tau}^{k}\right)_{k=0}^{N_{\tau}}$ of (38) satisfy the following upper energy-dissipation estimate:

$$
\begin{align*}
& \mathcal{K}\left(\mathrm{D}_{\tau} u_{\tau}^{L}\right)+\mathcal{E}\left(t_{\tau}^{L}, u_{\tau}^{L}, z_{\tau}^{L}\right)+\sum_{k=1}^{L} \tau 2 \mathcal{V}\left(z_{\tau}^{k} ; \mathrm{D}_{\tau} u_{\tau}^{k}\right)+\sum_{k=1}^{L} \tau 2 \mathcal{R}_{M \tau}\left(\mathrm{D}_{\tau} z_{\tau}^{k}\right) \\
& \quad \leq \mathcal{K}\left(\mathrm{D}_{\tau} u_{\tau}^{0}\right)+\mathcal{E}\left(t_{\tau}^{0}, u_{\tau}^{0}, z_{\tau}^{0}\right)-\tau \sum_{k=1}^{L}\left\langle\mathrm{D}_{\tau} f_{\tau}^{k}, u_{\tau}^{k-1}\right\rangle_{\mathbf{U}^{*}, \mathbf{U}} \tag{42}
\end{align*}
$$

Proof of Theorem 4.1. The weak convergence results (37) are direct consequences of the uniform a-priori bounds 26. The proofs of the remaining statements (38)-42] will be carried out subsequently in Subsections 4.1 - 4.5

For solutions $\left(u_{\tau}^{k}, z_{\tau}^{k}\right)_{k=1}^{N_{\tau}}$ obtained by solving (38), piecewise constant interpolants $\bar{v}_{\tau}, v_{\tau}$, and affine-linear approximations $v_{\tau}$ for $v \in\{u, z\}$ are introduced, defined for $t \in\left(t_{\tau}^{k-1}, t_{\tau}^{k}\right], k=1, \ldots N_{\tau}$, by

$$
\begin{equation*}
\bar{v}_{\tau}(t)=v_{\tau}^{k}, \underline{v}_{\tau}(t)=v_{\tau}^{k-1}, v_{\tau}(t)=\frac{t-t_{\tau}^{k-1}}{\tau} v_{\tau}^{k}+\frac{t_{\tau}^{k}-t}{\tau} v_{\tau}^{k-1} . \tag{43}
\end{equation*}
$$

In addition, we set for any $t \in\left(t_{\tau}^{k-1}, t_{\tau}^{k}\right]$

$$
\begin{equation*}
\bar{t}_{\tau}(t):=t_{\tau}^{k}, \quad \underline{t}_{\tau}(t):=t_{\tau}^{k-1} \tag{44}
\end{equation*}
$$

and for the stored energy

$$
\begin{equation*}
\hat{\mathcal{E}}(t, u, z):=\int_{\Omega}\left(\frac{1}{2} \mathbb{C}(z) e(u): e(u)+\left(\frac{1}{2 \ell}(1-z)^{2}+\frac{\ell}{2}|\nabla z|^{2}\right)\right) \mathrm{d} x-\langle\hat{f}(t), u\rangle_{\mathbf{U}^{*}, \mathbf{U}} \tag{45}
\end{equation*}
$$

with $\hat{\mathcal{E}} \in\left\{\mathcal{E}_{\tau}, \overline{\mathcal{E}}_{\tau}, \underline{\mathcal{E}}_{\tau}\right\}$ depending on the choice of the interpolant for the external force $\hat{f} \in\left\{f_{\tau}, \bar{f}_{\tau}, \underline{f}_{\tau}\right\}$. In this way, the time-discrete problem 38 as well as the upper energy-dissipation estimate [42] can be reformulated also for the interpolants. Here, also discrete integration by parts is used

$$
\begin{equation*}
\tau \sum_{k=1}^{L} \int_{\Omega} \frac{\dot{u}_{\tau}^{k}-\dot{u}_{\tau}^{k-1}}{\tau} \cdot v_{\tau}^{k} \mathrm{~d} x=\int_{\Omega}\left(\dot{u}_{\tau}^{L} \cdot v_{\tau}^{L}-\dot{u}_{\tau}^{0} \cdot v_{\tau}^{0}\right) \mathrm{d} x-\tau \sum_{k=1}^{L} \int_{\Omega} \dot{u}_{\tau}^{k-1} \cdot \frac{v_{\tau}{ }^{k}-v_{\tau}^{k-1}}{\tau} \mathrm{~d} x \tag{46}
\end{equation*}
$$

for any tuple $\left(v_{\tau}^{k}\right)_{k=0}^{L} \subset L^{2}\left(0, \mathrm{~T} ; L^{2}(\Omega)\right)$, to state the weak balance of momentum for the interpolants. Then, we have

$$
\begin{align*}
0= & \left\langle\mathrm{D}_{z} \overline{\mathcal{E}}_{\tau}\left(t, \underline{u}_{\tau}(t), \bar{z}_{\tau}(t)\right)+\mathrm{D} \mathcal{R}_{M \tau}\left(\dot{z}_{\tau}(t)\right), \eta\right\rangle_{\mathbf{x}^{*}, \mathbf{X}} \quad \text { for all } \eta \in \mathbf{Y},  \tag{47a}\\
0= & \rho \int_{\Omega} \dot{u}_{\tau}(t) \cdot \bar{v}_{\tau}(t)-\dot{u}_{\tau}(0) \cdot \bar{v}_{\tau}(0) d x-\rho \int_{0}^{\bar{\tau}_{\tau}(t)} \int_{\Omega} \dot{u}_{\tau}(r-\tau) \dot{v}_{\tau}(r) \mathrm{d} x \mathrm{~d} r  \tag{47b}\\
& +\int_{0}^{\bar{t}_{\tau}(t)} \int_{\Omega}\left[\mathbb{D}\left(\bar{z}_{\tau}(r)\right) e\left(\dot{u}_{\tau}(r)\right)+\mathbb{C}\left(\bar{z}_{\tau}(r)\right) e\left(\bar{u}_{\tau}(r)\right)\right]: e\left(\bar{v}_{\tau}(r)\right) \mathrm{d} x \mathrm{~d} r \\
& -\int_{0}^{\bar{\tau}_{\tau}(t)}\left\langle\bar{f}_{\tau}(r), \bar{v}_{\tau}(r)\right\rangle_{\mathbf{U}^{*}, \mathbf{U}} \mathrm{~d} r \tag{47c}
\end{align*}
$$

for all tuples $\left(v_{\tau}^{k}\right)_{k=0}^{N_{\tau}} \subset \mathbf{U}$ setting $\bar{v}(s):=v_{\tau}^{k}$ and $v_{\tau}(s):=\frac{t-t_{\tau}^{k-1}}{\tau} v_{\tau}^{k}+\frac{t_{\tau}^{k}-t}{\tau} v_{\tau}^{k-1}$ for $s \in\left(t_{\tau}^{k-1}, t_{\tau}^{k}\right]$, and

$$
\begin{align*}
& \mathcal{K}\left(\dot{u}_{\tau}(t)\right)+\overline{\mathcal{E}}_{\tau}\left(t, \bar{u}_{\tau}(t), \bar{z}_{\tau}(t)\right)+\int_{0}^{\bar{t}_{\tau}(t)} 2\left(\mathcal{V}\left(\bar{z}_{\tau}(r) ; \dot{u}_{\tau}(r)\right)+\mathcal{R}_{M \tau}\left(\dot{z}_{\tau}(r)\right)\right) \mathrm{d} r  \tag{47d}\\
& \quad \leq \mathcal{K}\left(\dot{u}_{\tau}(0)\right)+\mathcal{E}\left(0, \bar{u}_{\tau}(0), \bar{z}_{\tau}(0)\right)-\int_{0}^{\bar{t}_{\tau}(t)}\left\langle\dot{f}_{\tau}(t), \underline{u}_{\tau}(t)\right\rangle_{\mathbf{U}^{*}, \mathbf{U}}
\end{align*}
$$

Estimate 47d leads to the following uniform a priori estimates for the time-discrete interpolated solutions:
Proposition 4.2 (Uniform a-priori bounds for time-discrete solutions). Let the assumptions of Theorem 4.1 be satisfied. In addition, suppose that we have $z_{\tau}^{0}=z_{0}, u_{\tau}^{0}=u_{0}$ and $u_{\tau}^{-1}=u_{0}-\tau \dot{u}_{0}$ for all $\tau>0$. For the interpolants constructed by 43 with the time-discrete limit pairs $\left(u_{\tau}^{k}, z_{\tau}^{k}\right)_{k=1}^{N_{\tau}}$ found in (37, the following a priori estimates hold true with a constant $C>0$ independent of $\tau$ and $M$ :

$$
\begin{align*}
&\left\|\underline{u}_{\tau}\right\|_{L^{\infty}(0, \mathbf{T} ; \mathbf{U})}+\left\|\bar{u}_{\tau}\right\|_{L^{\infty}(0, \mathbf{T} ; \mathbf{U})} \leq C,  \tag{48a}\\
&\left\|\dot{u}_{\tau}\right\|_{L^{\infty}\left(0, \mathbf{T} ; L^{2}\left(\Omega, \mathbb{R}^{d}\right)\right)} \leq C,  \tag{48b}\\
&\left\|u_{\tau}\right\|_{H^{1}(0, \mathbf{T} ; \mathbf{U})} \leq C,  \tag{48c}\\
&\left\|\mathrm{D}_{\tau} \dot{u}_{\tau}\right\|_{L^{2}\left(0, \mathbf{T} ; \mathbf{U}^{*}\right)} \leq C,  \tag{48d}\\
&\left\|\underline{z}_{\tau}\right\|_{L^{\infty}(0, \mathbf{T} ; \mathbf{X})}+\left\|\bar{z}_{\tau}\right\|_{L^{\infty}(0, \mathbf{T} ; \mathbf{X})} \leq C,  \tag{48e}\\
&\left\|\dot{z}_{\tau}\right\|_{L^{2}\left(0, \mathbf{T} ; L^{2}(\Omega)\right)} \leq \frac{C}{\sqrt{M}},  \tag{48f}\\
&\left\|z_{\tau}\right\|_{H^{1}\left(0, \mathbf{T} ; L^{2}(\Omega)\right)} \leq \frac{C}{\sqrt{M}},  \tag{48g}\\
&\left\|\underline{z}_{\tau}\right\|_{B V\left(0, \mathbf{T} ; L^{1}(\Omega)\right)}+\left\|\bar{z}_{\tau}\right\|_{B V\left(0, \mathbf{T} ; L^{1}(\Omega)\right)} \leq C,  \tag{48h}\\
&\left\|\dot{z}_{\tau}\right\|_{L^{1}\left(0, \mathbf{T} ; L^{1}(\Omega)\right)} \leq C . \tag{48i}
\end{align*}
$$

The proof of Proposition 4.2 is carried out in detail in Section 4.6

### 4.1 Proof of (38b): Limit passage in the discrete momentum balance

We pass to the limit $n \rightarrow \infty$ in the fully discrete momentum balance $25 b$. For this, let $v \in \mathbf{U}$ be a test function of the space-continuous limit problem 38b and $\left(v_{h}\right)_{h} \subset \mathbf{U}$ such that $v_{h} \in \mathbf{U}_{h}$ for all $h \in \mathbb{N}$ are test functions for the finite-dimensional problems 25b with the property $v_{h} \rightarrow v$ strongly in $\mathbf{U}$. A sequence $\left(v_{n}\right)_{n}$ with these properties does exist, since $\cup_{n \in \mathbb{N}} \mathbf{U}_{n}$ is dense in $\mathbf{U}$ by assumption. Now, for the limit passage in 25b, i.e., in

$$
\begin{aligned}
0= & \int_{\Omega} \frac{u_{\tau h}^{k}-2 u_{\tau h}^{k-1}+u_{\tau h}^{k-2}}{\tau^{2}} \cdot v_{n}+\left[\mathbb{D}\left(z_{\tau h}^{k}\right) e\left(\frac{u_{\tau h}^{k}-u_{\tau h}^{k-1}}{\tau}\right)+\mathbb{C}\left(z_{\tau h}^{k}\right) e\left(u_{\tau}^{k}\right)\right]: e\left(v_{n}\right) \mathrm{d} x \\
& -\left\langle f_{\tau h}^{k}, v_{n}\right\rangle_{\mathbf{U}^{*}, \mathbf{U}}
\end{aligned}
$$

we see that convergence of the first summand is ensured by the weak convergence of the displacements in $\mathbf{U}$ from (37a) and the strong convergence $v_{n} \rightarrow v$ in $\mathbf{U}$. For the second and third summand, 37b implies by compactness that $z_{\tau h}^{k} \rightarrow z_{\tau}^{k}$ strongly in $L^{1}(\Omega)$, thus almost everywhere in $\Omega$ along a subsequence. Then, by continuity of $\mathbb{C}, \mathbb{D}$, cf. assumption 14a, there follows

$$
\mathbb{D}\left(z_{\tau h}^{k}\right) e\left(v_{n}\right) \rightarrow \mathbb{D}\left(z_{\tau}^{k}\right) e(v) \text { and } \mathbb{C}\left(z_{\tau h}^{k}\right) e\left(v_{n}\right) \rightarrow \mathbb{C}\left(z_{\tau}^{k}\right) e(v) \text { pointwise a.e. in } \Omega .
$$

Exploiting the uniform bounds on $\mathbb{D}$ and $\mathbb{C}$ in 15 a and 15 b , we conclude the convergence of the integrals using the dominated convergence theorem in a version with $n$-dependent majorants, cf. [RF17] Sec. 4.4, Thm. 19, p. 89]. Convergence of the external loading term follows from the strong convergence of the test functions together with strong convergence 24. This results in 38b.

### 4.2 Proof of (38a): Limit passage in the discrete phase-field equation

We consider the limit passage $n \rightarrow \infty$ in the discrete problem 25a. Let $\eta \in \mathbf{Y}$ be a test function for the spacecontinuous phase-field equation 38a. Let $\left(\eta_{n}\right)_{n} \subset \mathbf{X}_{n}$ such that $\eta_{n} \rightarrow \eta$ strongly in $\mathbf{X}$ and $\left\|\eta_{n}\right\|_{L^{\infty}(\Omega)} \leq c_{\eta}$ uniformly for all $n \in \mathbb{N}$. Using these test functions we now pass to the limit in 25a, i.e., in

$$
\begin{aligned}
0= & \left\langle\mathrm{D}_{z} \overline{\mathcal{E}}_{\tau}\left(t_{\tau}^{k}, u_{\tau h}^{k-1}, z_{\tau h}^{k}\right)+\mathrm{D} \mathcal{R}_{M \tau}\left(\frac{z_{\tau h}^{k}-z_{\tau h}^{k-1}}{\tau}\right), \eta_{n}\right\rangle_{\mathbf{X}^{*}, \mathbf{X}} \\
= & \int_{\Omega} \frac{1}{2} \mathbb{C}^{\prime}\left(z_{\tau h}^{k}\right) e\left(u_{\tau h}^{k-1}\right): e\left(u_{\tau h}^{k-1}\right) \eta_{n} \mathrm{~d} x+\int_{\Omega}\left(\ell \nabla z_{\tau h}^{k} \cdot \nabla \eta_{n}-\frac{1}{\ell}\left(1-z_{\tau h}^{k}\right) \eta_{n}\right) \mathrm{d} x \\
& +\int_{\Omega} M \frac{z_{\tau h-}^{k}-z_{\tau h}^{k-1}}{\tau} \eta_{n} \mathrm{~d} x+\int_{\Omega} \frac{N_{\tau}}{2} \frac{\mathrm{~d}}{\mathrm{~d} z} m_{+}^{2}\left(\frac{z_{\tau h}^{k}-z_{\tau h}^{k-1}}{\tau}\right) \eta_{n} \mathrm{~d} x .
\end{aligned}
$$

For the second and the third integral term on the right-hand side, convergence follows by weak-strong convergence arguments using (37b) together with the strong convergence of $\left(\eta_{n}\right)_{n}$. For the fourth integral on the right-hand side, that is the Yosida-regularization of the unidirectionality constraint, we find with 20 that $\frac{N_{\tau}}{2} \frac{\mathrm{~d}}{\mathrm{~d} z} m_{+}^{2}\left(\frac{z_{\tau h}^{k}-z_{\tau h}^{k-1}}{\tau}\right) \eta_{n}$ convergences pointwise almost everywhere in $\Omega$. In addition,

$$
\left|\frac{N_{\tau}}{2} \frac{\mathrm{~d}}{\mathrm{~d} z} m_{+}^{2}\left(\frac{z_{\tau h}^{k}-z_{\tau h}^{k-1}}{\tau}\right) \eta_{n}\right| \leq\left|N_{\tau}\left(\frac{z_{\tau h}^{k}-z_{\tau h}^{k-1}}{\tau}\right) \eta_{n}\right|,
$$

which provides an admissible summable majorant. Based on this, one can pass to the limit using the dominated convergence theorem [RF17] Sec. 4.4, Thm. 19, p. 89]. It remains to discuss the limit passage in the first integral on the right-hand side. For this, observe that the assumptions [14 on $w_{\mathbb{C}}$ imply together with the uniform bound on $\eta_{n}$ that

$$
\left|\eta_{n}\right| w_{\mathbb{C}}^{\prime}\left(z_{\tau h}^{k}\right) \leq c_{\eta} w_{\mathbb{C}}^{\prime}\left(z_{*}\right)
$$

for all $z_{\tau h}^{k}$, and thus

$$
\left|\eta_{n} \mathbb{C}^{\prime}\left(z_{\tau h}^{k}\right) e\left(u_{\tau h}^{k-1}\right): e\left(u_{\tau h}^{k-1}\right)\right| \leq c_{\eta} \mathbb{C}^{\prime}\left(z^{*}\right) e\left(u_{\tau h}^{k-1}\right): e\left(u_{\tau h}^{k-1}\right)
$$

Arguing by the dominated convergence theorem with $n$-dependent majorants provides the convergence of the corresponding integral term. Here we explicitly use the strong convergence $u_{\tau h}^{k-1} \rightarrow u_{\tau}^{k-1}$ in $\mathbf{U}$, cf. 40a, which is proved by induction in Lemma 4.3 right below. All in all we obtain 38a.

### 4.3 Proof of 40): Improved convergence

In the following we verify the strong convergence (40) with the aid of two separate lemmata:
Lemma 4.3 (Strong convergence of $\left(u_{\tau h}^{k}\right)_{n}$ ). Keep $k \in \mathbb{N}$ fixed. Assume that

$$
\begin{align*}
& u_{\tau h}^{k-1} \rightarrow u_{\tau}^{k-1} \text { in } \mathbf{U} \text { and } u_{\tau h}^{k-2} \rightarrow u_{\tau}^{k-2} \text { in } \mathbf{U},  \tag{49a}\\
& z_{\tau h}^{k} \rightarrow z_{\tau}^{k} \text { in } L^{2}(\Omega) . \tag{49b}
\end{align*}
$$

Then, the fully discrete solutions $\left(u_{\tau h}^{k}\right)_{n}$ satisfy the strong convergence result 40a.

Proof. In a first step we show that

$$
\begin{equation*}
\int_{\Omega}\left(\frac{1}{\tau} \mathbb{D}\left(z_{\tau h}^{k}\right)+\mathbb{C}\left(z_{\tau h}^{k}\right)\right) e\left(u_{\tau h}^{k}\right): e\left(u_{\tau h}^{k}\right) \mathrm{d} x \rightarrow \int_{\Omega}\left(\frac{1}{\tau} \mathbb{D}\left(z_{\tau}^{k}\right)+\mathbb{C}\left(z_{\tau}^{k}\right)\right) e\left(u_{\tau}^{k}\right): e\left(u_{\tau}^{k}\right) \mathrm{d} x \tag{50}
\end{equation*}
$$

For this, we test 25b with $u_{\tau h}^{k} \in \mathbf{U}_{n}$ and rearrange the terms as follows

$$
\begin{align*}
& \int_{\Omega}\left(\frac{1}{\tau} \mathbb{D}\left(z_{\tau h}^{k}\right)+\mathbb{C}\left(z_{\tau h}^{k}\right)\right) e\left(u_{\tau h}^{k}\right): e\left(u_{\tau h}^{k}\right) \mathrm{d} x \\
& =\frac{1}{\tau^{2}} \int_{\Omega}-\left|u_{\tau h}^{k}\right|^{2}+2 u_{\tau h}^{k-1} \cdot u_{\tau h}^{k}-u_{\tau h}^{k-2} \cdot u_{\tau h}^{k} \mathrm{~d} x+\int_{\Omega} \frac{1}{\tau} \mathbb{D}\left(z_{\tau h}^{k}\right) e\left(u_{\tau h}^{k-1}\right): e\left(u_{\tau h}^{k}\right) \mathrm{d} x  \tag{51}\\
& \quad+\left\langle f_{\tau h}^{k}, u_{\tau h}^{k}\right\rangle \mathbf{U}^{*}, \mathbf{U}
\end{align*}
$$

As $n \rightarrow \infty$ we obtain convergence of all three integrals on the right-hand side by the following arguments: For the first integral we have convergence due to $u_{\tau h}^{k} \rightarrow u_{\tau}^{k}$ strongly in $L^{2}(\Omega)$ by $37 a$ and the compact embedding of $\mathbf{U}$ in $L^{2}(\Omega)$ together with convergence assumption 49a, on $\left(u_{\tau h}^{k-1}\right)_{n}$ and $\left(u_{\tau h}^{k-2}\right)_{n}$. Moreover, the convergence of the external loading-term is a consequence of the strong convergence of the external forces in 96c and again 37a. The limit passage in the dissipation term on the right-hand side is guaranteed by 49a together with the uniform bound on $\mathbb{D}$, providing that $\frac{1}{\tau} \mathbb{D}\left(z_{\tau h}^{k}\right) e\left(u_{\tau h}^{k-1}\right) \rightarrow \frac{1}{\tau} \mathbb{D}\left(z_{\tau}^{k}\right) e\left(u_{\tau}^{k-1}\right)$ strongly in $L^{2}(\Omega)$. With the above arguments and using weak lower semicontinuity on the left-hand side of [51, we obtain the following chain of inequalities

$$
\begin{align*}
& \int_{\Omega}\left(\frac{1}{\tau} \mathbb{D}\left(z_{\tau}^{k}\right)+\mathbb{C}\left(z_{\tau}^{k}\right)\right) e\left(u_{\tau}^{k}\right): e\left(u_{\tau}^{k}\right) \mathrm{d} x \\
& \leq \liminf _{n \rightarrow \infty} \int_{\Omega}\left(\frac{1}{\tau} \mathbb{D}\left(z_{\tau h}^{k}\right)+\mathbb{C}\left(z_{\tau h}^{k}\right)\right) e\left(u_{\tau h}^{k}\right): e\left(u_{\tau h}^{k}\right) \mathrm{d} x \\
& \leq \limsup _{n \rightarrow \infty} \int_{\Omega}\left(\frac{1}{\tau} \mathbb{D}\left(z_{\tau h}^{k}\right)+\mathbb{C}\left(z_{\tau h}^{k}\right)\right) e\left(u_{\tau h}^{k}\right): e\left(u_{\tau h}^{k}\right) \mathrm{d} x  \tag{52}\\
& =\frac{1}{\tau^{2}} \int_{\Omega}-\left|u_{\tau}^{k}\right|^{2}+2 u_{\tau}^{k-1} \cdot u_{\tau}^{k}-u_{\tau}^{k-2} \cdot u_{\tau}^{k} \mathrm{~d} x+\int_{\Omega} \frac{1}{\tau} \mathbb{D}\left(z_{\tau}^{k}\right) e\left(u_{\tau}^{k-1}\right): e\left(u_{\tau}^{k}\right) \mathrm{d} x \\
& \quad+\left\langle f_{\tau}^{k}, u_{\tau}^{k}\right\rangle \mathbf{U}^{*}, \mathbf{U} \\
& =\int_{\Omega}\left(\frac{1}{\tau} \mathbb{D}\left(z_{\tau}^{k}\right)+\mathbb{C}\left(z_{\tau}^{k}\right)\right) e\left(u_{\tau}^{k}\right): e\left(u_{\tau}^{k}\right) \mathrm{d} x,
\end{align*}
$$

where the last equality in (52) is due to the fact that solutions $\left(u_{\tau}^{k}, z_{\tau}^{k}\right)$ satisfy the weak balance of momentum 38b with the test function $u_{\tau}^{k} \in \mathbf{U}$. Hence, (50) is proved.
Now, 50 can be used to conclude the desired strong convergence 40a. Making use of the projection operator $P_{n}^{\mathbf{U}}: \mathbf{U} \rightarrow$ $\mathbf{U}_{n}$, Korn's inequality, and the positive definiteness of the tensors $\mathbb{C}$ and $\mathbb{D}$, we estimate

$$
\begin{aligned}
c_{K}^{2} & \left\|u_{\tau h}^{k}-u_{\tau}^{k}\right\|_{\mathbf{U}}^{2} \leq\left\|e\left(u_{\tau h}^{k}\right)-e\left(u_{\tau}^{k}\right)\right\|_{L^{2}(\Omega)}^{2} \\
\leq & 2\left\|e\left(u_{\tau h}^{k}\right)-e\left(P_{n}^{\mathbf{U}}\left(u_{\tau}^{k}\right)\right)\right\|_{L^{2}(\Omega)}^{2}+2\left\|\left(P_{n}^{\mathbf{U}}\left(u_{\tau}^{k}\right)\right)-e\left(u_{\tau}^{k}\right)\right\|_{L^{2}(\Omega)}^{2} \\
\leq & 2\left(c_{\mathbb{D}}^{0}+c_{\mathbb{C}}^{0}\right)^{-1} \int_{\Omega}\left(\mathbb{D}\left(z_{\tau h}^{k}\right)+\mathbb{C}\left(z_{\tau h}^{k}\right)\right)\left[e\left(u_{\tau h}^{k}\right)-e\left(P_{n}^{\mathbf{U}}\left(u_{\tau}^{k}\right)\right)\right]:\left[e\left(u_{\tau h}^{k}\right)-e\left(P_{n}^{\mathbf{U}}\left(u_{\tau}^{k}\right)\right)\right] \mathrm{d} x \\
& +\left\|e\left(P_{n}^{\mathbf{U}}\left(u_{\tau}^{k}\right)\right)-e\left(u_{\tau}^{k}\right)\right\|_{L^{2}}^{2} \rightarrow 0 .
\end{aligned}
$$

The latter summand converges to 0 as an intrinsic property of the projection operator. The first summand on the rightmost side converges to 0 as a consequence of 50 and further weak-strong convergence arguments. Thus, the assertion follows.

Lemma 4.4 (Strong convergence of $\left.\left(z_{\tau h}^{k}\right)_{n}\right)$. Keep $k \in \mathbb{N}$ fixed. Assume that the first of 49a, holds true and in addition also

$$
\begin{equation*}
z_{\tau h}^{k-1} \rightarrow z_{\tau}^{k-1} \quad \text { in } \mathbf{Z} . \tag{53}
\end{equation*}
$$

Then, the fully discrete solutions $\left(z_{\tau h}^{k}\right)_{n}$ satisfy the strong convergence result 40b.
Proof. To find the desired strong convergence 40b we will show that

$$
\begin{equation*}
\left\|\nabla z_{\tau}^{k}\right\|_{L^{2}(\Omega)}^{2} \leq \liminf _{n \rightarrow \infty}\left\|\nabla z_{\tau h}^{k}\right\|_{L^{2}(\Omega)}^{2} \leq \limsup _{n \rightarrow \infty}\left\|\nabla z_{\tau h}^{k}\right\|_{L^{2}(\Omega)}^{2} \leq\left\|\nabla z_{\tau}^{k}\right\|_{L^{2}(\Omega)}^{2} \tag{54}
\end{equation*}
$$

Here, the first estimate in 54] follows by weak lower semicontinuity and weak convergence 37b] and the second estimate is immediate. To verify the third estimate in 54, we will make use of the discrete equation 38a. More precisely, we test (38a) with $z_{\tau h}^{k} \in \mathbf{Z}_{n}$ and rearrange the terms as follows

$$
\begin{align*}
& \int_{\Omega} \ell\left|\nabla z_{\tau h}^{k}\right|^{2} \mathrm{~d} x \\
& =-\int_{\Omega} \frac{1}{2} z_{\tau h}^{k} \mathbb{C}^{\prime}\left(z_{\tau h}^{k}\right) e\left(u_{\tau h}^{k-1}\right): e\left(u_{\tau h}^{k-1}\right) \mathrm{d} x  \tag{55}\\
& \quad+\int_{\Omega}\left(\frac{1}{\ell}\left(1-z_{\tau h}^{k}\right) z_{\tau h}^{k}-M \frac{z_{\tau h}^{k}-z_{\tau h}^{k-1}}{\tau} z_{\tau h}^{k}-\frac{N_{\tau}}{2} \frac{\mathrm{~d}}{\mathrm{~d} z} m_{+}^{2}\left(\frac{z_{\tau h}^{k}-z_{\tau h}^{k-1}}{\tau}\right) z_{\tau h}^{k}\right) \mathrm{d} x .
\end{align*}
$$

We discuss the limit $n \rightarrow \infty$ for the terms on the right-hand side of 55 . Thanks to the convergence $z_{\tau h}^{k} \rightharpoonup z_{\tau}^{k}$ in $\mathbf{X}$ by (37b) and by the compact embedding of $H^{1}(\Omega)$ into $L^{2}(\Omega)$ we have $z_{\tau h}^{k} \rightarrow z_{\tau}^{k}$ in $L^{2}(\Omega)$. A similar result also holds true for $\left(z_{\tau h}^{k-1}\right)_{n}$. Note that, by [20, $\frac{\mathrm{d}}{\mathrm{d} z} m_{+}^{2}\left(\frac{z_{\tau h}^{k}-z_{\tau h}^{k-1}}{\tau}\right)=2\left(\frac{z_{\tau h}^{k}-z_{\tau h}^{k-1}}{\tau}\right)$ for $\left(z_{\tau h}^{k}-z_{\tau h}^{k-1}\right)>0$ and $\frac{\mathrm{d}}{\mathrm{d} z} m_{+}^{2}\left(\frac{z_{\tau h}^{k}-z_{\tau h}^{k-1}}{\tau}\right)=$ 0 for $\left(z_{\tau h}^{k}-z_{\tau h}^{k-1}\right) \leq 0$, hence $L^{2}$-convergence supplemented by dominated convergence is sufficient to pass to the limit also in this term. With these arguments the convergence of the second integral on the right-hand side of 55 is ensured. Instead, the first integral on the right-hand side (55) requires further investigation. Since there is no uniform $L^{\infty}$-bound available for $z_{\tau h}^{k}$, we instead exploit the properties of the degradation function $w_{\mathbb{C}}$. More precisely, properties 14 imply the estimate

$$
0 \leq z_{\tau h}^{k} w_{\mathbb{C}}^{\prime}\left(z_{\tau h}^{k}\right) \leq z^{*} w_{\mathbb{C}}^{\prime}\left(z_{*}\right) \quad \text { for all } z_{\tau h}^{k} \in \mathbb{R}
$$

This further implies that

$$
\begin{equation*}
0 \leq z_{\tau h}^{k} \mathbb{C}^{\prime}\left(z_{\tau h}^{k}\right) e\left(u_{\tau h}^{k-1}\right): e\left(u_{\tau h}^{k-1}\right) \leq z^{*} \mathbb{C}^{\prime}\left(z_{*}\right) e\left(u_{\tau h}^{k-1}\right): e\left(u_{\tau h}^{k-1}\right), \tag{56}
\end{equation*}
$$

and the right-hand side of (56) provides a convergent, integrable majorant thanks to 49a. Hence, we can pass to the limit also in the first integral term on the right-hand side of (55] with the aid of the dominated convergence theorem [RF17] Sec. 4.4, Thm. 19, p. 89]. Since above arguments ensure the convergence of all the integral terms on the right-hand side of (55), we are entitled to conclude that

$$
\begin{aligned}
& \limsup _{n \rightarrow \infty} \int_{\Omega} \ell\left|\nabla z_{\tau h}^{k}\right|^{2} \mathrm{~d} x \\
& =-\int_{\Omega} \frac{1}{2} z_{\tau}^{k} \mathbb{C}^{\prime}\left(z_{\tau}^{k}\right) e\left(u_{\tau}^{k-1}\right): e\left(u_{\tau}^{k-1}\right) \mathrm{d} x \\
& \quad+\int_{\Omega}\left(\frac{1}{\ell}\left(1-z_{\tau}^{k}\right) z_{\tau}^{k}-M \frac{z_{\tau}^{k}-z_{\tau}^{k-1}}{\tau} z_{\tau h}^{k}-\frac{N_{\tau}}{2} \frac{\mathrm{~d}}{\mathrm{~d} z} m_{+}^{2}\left(\frac{z_{\tau}^{k}-z_{\tau}^{k-1}}{\tau}\right) z_{\tau}^{k}\right) \mathrm{d} x . \\
& =\int_{\Omega} \ell\left|\nabla z_{\tau}^{k}\right|^{2} \mathrm{~d} x
\end{aligned}
$$

Here, the last equality stems from the fact that $z_{\tau}^{k}$ satisfies the time-discrete evolution equation 38a with the specific test function $z_{\tau}^{k}$. In view of (54) the assertion is verified.

Conclusion of 40 We argue with the aid of Lemmata 4.3 . 4.4 by induction. For this, we note that prerequisites 49a and (53) are fulfilled by the initial data thanks to assumption (39) of Theorem 4.1 Moreover, for each $k \in\left\{1, \ldots, N_{\tau}\right\}$ prerequisite (49b] directly follows from weak convergence result 3 37b by the compact embedding of $\mathbf{Z}=H^{1}(\Omega)$ into $L^{2}(\Omega)$. Hence, for $k=1$ Lemmata 4.3. 4.4 provide the strong convergence of the fully discrete solutions $\left(u_{\tau h}^{1}, z_{\tau h}^{1}\right)_{n}$. Now (40) follows by induction.

### 4.4 Proof of 41: Boundedness of solutions $z_{\tau}^{k}$ in $[0,1]$

We argue with a recursion argument by contradiction. For that, we will assume that $z_{\tau}^{k-1} \in[0,1]$ a.e. in $\Omega$, but that $z_{\tau}^{k} \notin[0,1]$ on a set $B \subset \Omega$ of strictly positive measure. To simplify the argument we will assume that $z_{\tau}^{k}(x)$ for a.a. $x \in B$ takes its values in one of the three intervals $\left[z_{\ominus}, 0\right),\left(1, z^{*}\right]$ and $\left(z^{*}, z_{\oplus}\right]$, see Fig. 11 and deduce a contradiction separately in each of the three intervals. For this, we will test the time-discrete phase-field equation (38a) by a suitable cut-off of a solution $z_{\tau}^{k}$. More precisely, this will involve the composition of the Lipschitz-continuous functions max $\{\cdot, \cdot\}$ and $\min \{\cdot, \cdot\}$ with Sobolev functions $z, g \in \mathbf{X}=H^{1}(\Omega)$. We remark that, indeed $\max \{z, g\}, \min \{z, g\} \in \mathbf{X}$ for $z, g \in \mathbf{X}$ thanks to MM79.
Case $\left[z_{\ominus}, 0\right)$ : Let $z_{\ominus} \ll 0$ as in Fig. 1 p. 7 Suppose that there is a set $B_{1} \subset \Omega$ with $\mathcal{L}^{d}\left(B_{1}\right)>0$ such that $z_{\ominus} \leq z_{\tau}^{k}<0$ a.e. in $B_{1}$. We define an admissible testfunction for 38a by $\tilde{\eta}=-P_{\left[z_{\ominus}, 0\right]}\left(z_{\tau}^{k}\right)=-\min \left\{0, \max \left\{z_{\ominus}, z_{\tau}^{k}\right\}\right\}$, which is the projection onto $\left[z_{\ominus}, 0\right] \subset \mathbb{R}$. Then

$$
\begin{aligned}
0= & \left\langle\mathrm{D}_{z} \overline{\mathcal{E}}_{\tau}\left(t_{\tau}^{k}, u_{\tau}^{k-1}, z_{\tau}^{k}\right)+\mathrm{D} \mathcal{R}_{M \tau}\left(\mathrm{D}_{\tau} z_{\tau}^{k}\right), \tilde{\eta}\right\rangle_{\mathbf{x}^{*}, \mathbf{x}} \\
= & \int_{\left\{z_{\tau}^{k}<z_{\ominus}\right\}}-\frac{1}{\ell}\left(1-z_{\tau}^{k}\right)\left(-z_{\ominus}\right)+\mathrm{DR}_{M \tau}\left(\mathrm{D}_{\tau} z_{\tau}^{k}\right)\left(-z_{\ominus}\right) \mathrm{d} x \\
& +\int_{\left\{z_{\ominus} \leq z_{\tau}^{k}<0\right\}}-\frac{1}{\ell}\left(1-z_{\tau}^{k}\right)\left(-z_{\tau}^{k}\right)-\ell\left|\nabla z_{\tau}^{k}\right|^{2}+\mathrm{DR}_{M \tau}\left(\mathrm{D}_{\tau} z_{\tau}^{k}\right)\left(-z_{\tau}^{k}\right) \mathrm{d} x \\
\leq & \int_{B_{1}}-\frac{1}{\ell}\left(1-z_{\tau}^{k}\right)\left(-z_{\tau}^{k}\right)<0 .
\end{aligned}
$$

The last inequality is strict and thus by contradiction it follows that $\mathcal{L}^{d}\left(B_{1}\right)=0$. Here and in the following, we also use the notation $\{z<g\}:=\{x \in \Omega, z(x)<g(x)\}$.

Case $\left(z^{*}, z_{\oplus}\right]$ : Let $1<z_{*}<z^{*}<z_{\oplus}$ as in Fig. 1 Assume that there is a set $B_{2} \subset \Omega$ with $\mathcal{L}^{d}\left(B_{2}\right)>0$ such that $z^{*}<z_{\tau}^{k} \leq z_{\oplus}$ a.e. in $B_{2}$. As an admissible test function for 38a we set $\tilde{\eta}=P_{\left[z^{*}, z_{\oplus}\right]}\left(z_{\tau}^{k}\right)-z^{*}=$ $\min \left\{z_{\oplus}, \max \left\{z^{*}, z_{\tau}^{k}\right\}\right\}-z^{*}$. Then

$$
\begin{aligned}
0= & \int_{\left\{z^{*}<z_{\tau}^{k} \leq z_{\oplus}\right\}}-\frac{1}{\ell}\left(1-z_{\tau}^{k}\right)\left(z_{\tau}^{k}-z^{*}\right)+\ell\left|\nabla z_{\tau}^{k}\right|^{2}+\mathrm{DR}_{M \tau}\left(\mathrm{D}_{\tau} z_{\tau}^{k}\right)\left(z_{\tau}^{k}-z^{*}\right) \mathrm{d} x \\
& +\int_{\left\{z_{\oplus}<z_{\tau}^{k}\right\}}-\frac{1}{\ell}\left(1-z_{\tau}^{k}\right)\left(z_{\oplus}-z^{*}\right)+\mathrm{DR}_{M \tau}\left(\mathrm{D}_{\tau} z_{\tau}^{k}\right)\left(z_{\oplus}-z^{*}\right) \mathrm{d} x \\
\geq & \int_{B_{2}}-\frac{1}{\ell}\left(1-z_{\tau}^{k}\right)\left(z_{\oplus}-z^{*}\right) \mathrm{d} x>0
\end{aligned}
$$

where the last inequality is strict by $1<z^{*}<z_{\oplus}$ and the assumption on $B_{2}$. We obtain by contradiction that $\mathcal{L}^{d}\left(B_{2}\right)=0$.

Case $\left(1, z^{*}\right]$ : Suppose that there exists a set $B_{3} \subset \Omega$ such that $\mathcal{L}^{d}\left(B_{3}\right) \neq 0$ and $1<z_{\tau}^{k} \leq z^{*}$ a.e. in $B_{3}$. Let $\tilde{\eta}=-\left(P_{\left[1, z^{*}\right]}\left(z_{\tau}^{k}\right)-1\right)=-\left(\min \left\{z^{*}, \max \left\{1, z_{\tau}^{k}\right\}\right\}-1\right)$ be the test function for 38a, thus

$$
\begin{aligned}
0= & \int_{\left\{1<z_{\tau}^{k} \leq z^{*}\right\}}\left(\frac{1}{2} \mathbb{C}^{\prime}\left(z_{\tau}^{k}\right) e\left(u_{\tau}^{k-1}\right): e\left(u_{\tau}^{k-1}\right)\left(1-z_{\tau}^{k}\right)-\frac{1}{\ell}\left(1-z_{\tau}^{k}\right)\left(1-z_{\tau}^{k}\right)-\ell\left|\nabla z_{\tau}^{k}\right|^{2}\right) \mathrm{d} x \\
& +\int_{\left\{1<z_{\tau}^{k} \leq z^{*}\right\}} \mathrm{DR}_{M \tau}\left(\mathrm{D}_{\tau} z_{\tau}^{k}\right)\left(1-z_{\tau}^{k}\right) \mathrm{d} x+\int_{\left\{z^{*}<z_{\tau}^{k}\right\}} \mathrm{DR}_{M \tau}\left(\mathrm{D}_{\tau} z_{\tau}^{k}\right)\left(1-z^{*}\right) \mathrm{d} x \\
& +\int_{\left\{z^{*}<z_{\tau}^{k}\right\}}\left(\frac{1}{2} \mathbb{C}^{\prime}\left(z_{\tau}^{k}\right) e\left(u_{\tau}^{k-1}\right): e\left(u_{\tau}^{k-1}\right)\left(1-z^{*}\right)-\frac{1}{\ell}\left(1-z_{\tau}^{k}\right)\left(1-z^{*}\right)\right) \mathrm{d} x \\
\leq & \int_{B_{3}}-\frac{1}{\ell}\left(1-z_{\tau}^{k}\right)^{2} \mathrm{~d} x<0,
\end{aligned}
$$

which leads us to conclude that $\mathcal{L}^{d}\left(B_{3}\right)=0$.
Since we require in 18 for the initial datum that $z_{0}(x) \in[0,1]$ for a.e. $x \in \Omega$, it follows that the time-discrete, spacecontinuous solutions for the phase-field variable are bounded with values in $[0,1]$ almost everywhere in $\Omega$.

### 4.5 Proof of 42): Upper energy dissipation estimate for $\left(u_{\tau}^{k}, z_{\tau}^{k}\right)_{k=0}^{N_{\tau}}$

To deduce the upper energy-dissipation estimate [42, we first test the discrete momentum balance (38b] at time-step $k \in\left\{1, \ldots, N_{\tau}\right\}$ with $\mathrm{D}_{\tau} u_{\tau}^{k}$, i.e.,

$$
\begin{equation*}
0=\left\langle\rho \mathbf{D}_{\tau}^{2} u_{\tau}^{k}+\mathrm{D}_{u} \overline{\mathcal{E}}_{\tau}\left(t_{\tau}^{k}, u_{\tau}^{k}, z_{\tau}^{k}\right)+\mathrm{D} \mathcal{V}\left(z_{\tau}^{k} ; \mathrm{D}_{\tau} u_{\tau}^{k}\right), \mathrm{D}_{\tau} u_{\tau}^{k}\right\rangle_{\mathbf{U}^{*}, \mathbf{U}} \tag{57}
\end{equation*}
$$

Here, all the terms involved in 57, are derivatives of convex functionals and we will thus further estimate each of the terms separately by convexity arguments. We start with the elastic contribution contained in the energy given by the map $u \mapsto \int_{\Omega} \frac{1}{2} \mathbb{C}\left(z_{\tau}^{k}\right) e(u): e(u) \mathrm{d} x$. By convexity we estimate

$$
\begin{align*}
& \int_{\Omega} \mathbb{C}\left(z_{\tau}^{k}\right) e\left(u_{\tau}^{k}\right): e\left(\mathbf{D}_{\tau} u_{\tau}^{k}\right) \mathrm{d} x=\frac{1}{\tau} \int_{\Omega} \mathbb{C}\left(z_{\tau}^{k}\right) e\left(u_{\tau}^{k}\right): e\left(u_{\tau}^{k}-u_{\tau}^{k-1}\right) \mathrm{d} x \\
& \geq \frac{1}{\tau} \int_{\Omega}\left(\frac{1}{2} \mathbb{C}\left(z_{\tau}^{k}\right) e\left(u_{\tau}^{k}\right): e\left(u_{\tau}^{k}\right)-\frac{1}{2} \mathbb{C}\left(z_{\tau}^{k}\right) e\left(u_{\tau}^{k-1}\right): e\left(u_{\tau}^{k-1}\right)\right) \mathrm{d} x \tag{58}
\end{align*}
$$

Since also the map $u \mapsto \int_{\Omega} \frac{\rho}{2} \frac{|u|^{2}}{\tau^{2}} \mathrm{~d} x$ is convex, we can estimate the inertial term in 57) as follows

$$
\begin{align*}
& \left\langle\rho \mathrm{D}_{\tau}^{2} u_{\tau}^{k}, \mathrm{D}_{\tau} u_{\tau}^{k}\right\rangle_{\mathbf{U}^{*}, \mathbf{U}}=\int_{\Omega} \rho \mathrm{D}_{\tau}^{2} u_{\tau}^{k} \cdot \mathrm{D}_{\tau} u_{\tau}^{k} \mathrm{~d} x=\int_{\Omega} \frac{\rho}{\tau} \mathrm{D}_{\tau} u_{\tau}^{k} \cdot\left(\mathrm{D}_{\tau} u_{\tau}^{k}-\mathrm{D}_{\tau} u_{\tau}^{k-1}\right) \mathrm{d} x \\
& \geq \frac{1}{\tau} \int_{\Omega}\left(\frac{\rho}{2}\left|\mathrm{D}_{\tau} u_{\tau}^{k}\right|^{2}-\frac{\rho}{2}\left|\mathrm{D}_{\tau} u_{\tau}^{k-1}\right|^{2}\right) \mathrm{d} x \tag{59}
\end{align*}
$$

Moreover, the term involving the external loading can be reformulated as

$$
\begin{align*}
& -\left\langle f_{\tau}^{k}, \mathrm{D}_{\tau} u_{\tau}^{k}\right\rangle_{\mathbf{U}^{*}, \mathbf{U}}=-\frac{1}{\tau}\left\langle f_{\tau}^{k}, u_{\tau}^{k}-u_{\tau}^{k-1}\right\rangle_{\mathbf{U}^{*}, \mathbf{U}} \\
& =-\frac{1}{\tau}\left\langle f_{\tau}^{k}, u_{\tau}^{k}\right\rangle_{\mathbf{U}^{*}, \mathbf{U}}+\frac{1}{\tau}\left\langle f_{\tau}^{k-1}, u_{\tau}^{k-1}\right\rangle_{\mathbf{U}^{*}, \mathbf{U}}+\frac{1}{\tau}\left\langle f_{\tau}^{k}-f_{\tau}^{k-1}, u_{\tau}^{k-1}\right\rangle_{\mathbf{U}^{*}, \mathbf{U}} \tag{60}
\end{align*}
$$

Using relations 58-60 in 57) we arrive at

$$
\begin{align*}
0= & \left\langle\rho \mathbf{D}_{\tau}^{2} u_{\tau}^{k}+\mathrm{D}_{u} \overline{\mathcal{E}}_{\tau}\left(t_{\tau}^{k}, u_{\tau}^{k}, z_{\tau}^{k}\right)+\mathrm{D} \mathcal{V}\left(z_{\tau}^{k} ; \mathrm{D}_{\tau} u_{\tau}^{k}\right), \mathrm{D}_{\tau} u_{\tau}^{k}\right\rangle_{\mathbf{U}^{*}, \mathbf{U}} \\
\geq & \frac{1}{\tau} \int_{\Omega}\left(\frac{\rho}{2}\left|\mathbf{D}_{\tau} u_{\tau}^{k}\right|^{2}-\frac{\rho}{2}\left|\mathbf{D}_{\tau} u_{\tau}^{k-1}\right|^{2}\right) \mathrm{d} x+\int_{\Omega} \mathbb{D}\left(z_{\tau}^{k}\right) e\left(\mathbf{D}_{\tau} u_{\tau}^{k}\right): e\left(\mathbf{D}_{\tau} u_{\tau}^{k}\right) \mathrm{d} x \\
& +\frac{1}{\tau} \int_{\Omega}\left(\frac{1}{2} \mathbb{C}\left(z_{\tau}^{k}\right) e\left(u_{\tau}^{k}\right): e\left(u_{\tau}^{k}\right)-\frac{1}{2} \mathbb{C}\left(z_{\tau}^{k}\right) e\left(u_{\tau}^{k-1}\right): e\left(u_{\tau}^{k-1}\right)\right) \mathrm{d} x  \tag{61}\\
& -\frac{1}{\tau}\left\langle f_{\tau}^{k}, u_{\tau}^{k}\right\rangle_{\mathbf{U}^{*}, \mathbf{U}}+\frac{1}{\tau}\left\langle f_{\tau}^{k-1}, u_{\tau}^{k-1}\right\rangle_{\mathbf{U}^{*}, \mathbf{U}}+\frac{1}{\tau}\left\langle f_{\tau}^{k}-f_{\tau}^{k-1}, u_{\tau}^{k-1}\right\rangle_{\mathbf{U}^{*}, \mathbf{U}} .
\end{align*}
$$

Secondly, we test the time-discrete phase-field equation 38a at time-step $k \in\left\{1, \ldots, N_{\tau}\right\}$ with $\mathrm{D}_{\tau} z_{\tau}^{k}$, i.e.,

$$
\begin{equation*}
0=\left\langle\mathrm{D}_{z} \overline{\mathcal{E}}_{\tau}\left(t_{\tau}^{k}, u_{\tau}^{k-1}, z_{\tau}^{k}\right)+\mathrm{D} \mathcal{R}_{M \tau}\left(\mathrm{D}_{\tau} z_{\tau}^{k}\right), \mathrm{D}_{\tau} z_{\tau}^{k}\right\rangle \mathbf{X}^{*}, \mathbf{X} \tag{62}
\end{equation*}
$$

We observe that $\mathrm{D}_{z} \mathcal{E}\left(t_{\tau}^{k}, u_{\tau}^{k-1}, z_{\tau}^{k}\right)$ stems from the following energy contributions: a convex map

$$
z \mapsto \int_{\Omega}\left(\frac{\ell}{2}|\nabla z|^{2}+\frac{1}{2 \ell}\left(z^{2}+1\right)\right) \mathrm{d} x
$$

the linear contribution $z \mapsto \int_{\Omega}-\frac{1}{\ell} z \mathrm{~d} x$ and the contribution $z \mapsto \int_{\Omega} \frac{1}{2} \mathbb{C}(z) e\left(u_{\tau}^{k-1}\right): e\left(u_{\tau}^{k-1}\right) \mathrm{d} x$. For this third contribution we observe that it is convex as well, if $z \in\left[0, z_{*}\right]$ by 14 d . Since even $z_{\tau}^{k} \in[0,1]$ a.e. in $\Omega$ thanks to 41, this convexity relation is available for estimates in 62. In this way, we may estimate the energy terms in 62 from below by convexity and linearity as follows

$$
\begin{align*}
0= & \left\langle\mathbf{D}_{z} \overline{\mathcal{E}}_{\tau}\left(t_{\tau}^{k}, u_{\tau}^{k-1}, z_{\tau}^{k}\right)+\mathrm{D} \mathcal{R}_{M \tau}\left(\mathrm{D}_{\tau} z_{\tau}^{k}\right), \mathrm{D}_{\tau} z_{\tau}^{k}\right\rangle \mathbf{x}^{*}, \mathbf{X} \\
\geq & \frac{1}{\tau} \int_{\Omega} \frac{1}{2}\left(\mathbb{C}\left(z_{\tau}^{k}\right) e\left(u_{\tau}^{k-1}\right): e\left(u_{\tau}^{k-1}\right)-\frac{1}{2} \mathbb{C}\left(z_{\tau}^{k-1}\right) e\left(u_{\tau}^{k-1}\right): e\left(u_{\tau}^{k-1}\right)\right) \mathrm{d} x \\
& +\frac{1}{\tau} \int_{\Omega}\left(\frac{1}{2 \ell}\left(1-z_{\tau}^{k}\right)^{2}+\frac{\ell}{2}\left|\nabla z_{\tau}^{k}\right|^{2}-\frac{1}{2 \ell}\left(1-z_{\tau}^{k-1}\right)^{2}-\frac{\ell}{2}\left|\nabla z_{\tau}^{k-1}\right|^{2}\right) \mathrm{d} x  \tag{63}\\
& +2 \mathcal{R}_{M \tau}\left(\mathrm{D}_{\tau} z_{\tau}^{k}\right),
\end{align*}
$$

where we used that $\left\langle\mathrm{D} \mathcal{R}_{M \tau}\left(\mathrm{D}_{\tau} z_{\tau}^{k}\right), \mathrm{D}_{\tau} z_{\tau}^{k}\right\rangle \mathbf{X}^{*}, \mathbf{X}=2 \mathcal{R}_{M \tau}\left(\mathrm{D}_{\tau} z_{\tau}^{k}\right)$ due to the quadratic growth of the terms involved. Next, we add 61 and 63 and multiply by $\tau$. Hereby, we also exploit the cancellation of the terms

$$
\pm \frac{1}{\tau} \int_{\Omega} \frac{1}{2} \mathbb{C}\left(z_{\tau}^{k}\right) e\left(u_{\tau}^{k-1}\right): e\left(u_{\tau}^{k-1}\right) \mathrm{d} x
$$

which appear in 61 and in 63 with opposite signs. This procedure results in

$$
\begin{align*}
0 \geq & \int_{\Omega} \frac{\rho}{2}\left|\mathrm{D}_{\tau} u_{\tau}^{k}\right|^{2}-\frac{\rho}{2}\left|\mathrm{D}_{\tau} u_{\tau}^{k-1}\right|^{2} \mathrm{~d} x \\
& +\tau \int_{\Omega} \mathbb{D}\left(z_{\tau}^{k}\right) e\left(\mathrm{D}_{\tau} u_{\tau}^{k}\right): e\left(\mathrm{D}_{\tau} u_{\tau}^{k}\right) \mathrm{d} x+\tau 2 \mathcal{R}_{M \tau}\left(\mathrm{D}_{\tau} u_{\tau}^{k}\right) \\
& +\int_{\Omega} \frac{1}{2} \mathbb{C}\left(z_{\tau}^{k}\right) e\left(u_{\tau}^{k}\right): e\left(u_{\tau}^{k}\right)-\frac{1}{2} \mathbb{C}\left(z_{\tau}^{k-1}\right) e\left(u_{\tau}^{k-1}\right): e\left(u_{\tau}^{k-1}\right) \mathrm{d} x \\
& +\int_{\Omega} \frac{1}{2 \ell}\left(1-z_{\tau}^{k}\right)^{2}+\frac{\ell}{2}\left|\nabla z_{\tau}^{k}\right|^{2} \mathrm{~d} x-\int_{\Omega} \frac{1}{2 \ell}\left(1-z_{\tau}^{k-1}\right)^{2}+\frac{\ell}{2}\left|\nabla z_{\tau}^{k-1}\right|^{2} \mathrm{~d} x  \tag{64}\\
& -\left\langle f_{\tau}^{k}, u_{\tau}^{k}\right\rangle_{\mathbf{U}^{*}, \mathbf{U}}+\left\langle f_{\tau}^{k-1}, u_{\tau}^{k-1}\right\rangle_{\mathbf{U}^{*}, \mathbf{U}}+\tau\left\langle\mathrm{D}_{\tau} f_{\tau}^{k}, u_{\tau}^{k-1}\right\rangle_{\mathbf{U}^{*}, \mathbf{U}} \\
= & \mathcal{K}\left(\mathrm{D}_{\tau} u_{\tau}^{k}\right)+\mathcal{E}\left(t_{\tau}^{k}, u_{\tau}^{k}, z_{\tau}^{k}\right)+\tau\left(2 \mathcal{V}\left(z_{\tau}^{k} ; \mathrm{D}_{\tau} u_{\tau}^{k}\right)+2 \mathcal{R}_{M \tau}\left(\mathrm{D}_{\tau} z_{\tau}^{k}\right)\right) \\
& -\mathcal{K}\left(\mathrm{D}_{\tau} u_{\tau}^{k-1}\right)-\mathcal{E}\left(t_{\tau}^{k-1}, u_{\tau}^{k-1}, z_{\tau}^{k-1}\right)+\tau\left\langle\mathrm{D}_{\tau} f_{\tau}^{k}, u_{\tau}^{k-1}\right\rangle_{\mathbf{U}^{*}, \mathbf{U}}
\end{align*}
$$

Now we sum 64 over $k=1, \ldots, L$ for some index $L \in\left\{1, \ldots, N_{\tau}\right\}$. Exploiting further cancellations in the resulting telescopic sum ultimately leads to

$$
\begin{aligned}
0 \geq & \mathcal{K}\left(\mathrm{D}_{\tau} u_{\tau}^{L}\right)+\mathcal{E}\left(t_{\tau}^{L}, u_{\tau}^{L}, z_{\tau}^{L}\right)+\sum_{k=1}^{L} \tau\left(2 \mathcal{V}\left(z_{\tau}^{k} ; \mathrm{D}_{\tau} u_{\tau}^{k}\right)+2 \mathcal{R}_{M \tau}\left(\mathrm{D}_{\tau} z_{\tau}^{k}\right)\right) \\
& -\mathcal{K}\left(\mathrm{D}_{\tau} u_{\tau}^{0}\right)+\mathcal{E}\left(t_{\tau}^{0}, u_{\tau}^{0}, z_{\tau}^{0}\right)+\sum_{k=1}^{L} \tau\left\langle\mathrm{D}_{\tau} f_{\tau}^{k}, u_{\tau}^{k-1}\right\rangle_{\mathbf{U}^{*}, \mathbf{U}}
\end{aligned}
$$

which is the time-discrete upper energy-dissipation estimate 42.

### 4.6 Proof of Proposition 4.2

The proof of the a-priori bounds 48 is based on the upper energy-dissipation estimate 47d. Note that on the left-hand side in (47d) it appears the piecewise constant interpolant $\overline{\mathcal{E}}_{\tau}$ of the stored energy while on the right-hand side (the timederivative of) the piecewise affine-linear interpolant (see definitions in (45) is used. Both interpolants coincide on nodes $t_{\tau}^{k}$ of a partition $\Pi_{\tau}=\left\{0=t_{\tau}^{0}<t_{\tau}^{1} \ldots<t_{\tau}^{N_{\tau}}=\mathrm{T}\right\}$ of the time interval.

To find a uniform bound for the right-hand side of 47d requires an energetic control of the power of the time-discrete energy functional $\mathcal{E}_{\tau}$ from 45,

There are constants $\tilde{c}, \hat{c}$ such that for all $(u, z)$ with $\mathcal{E}(0, u, z)<\infty$ it is

$$
\begin{gather*}
\mathcal{E}_{\tau}(\cdot, u, z) \in W^{1,1}(0, \mathrm{~T}), \partial_{t} \mathcal{E}_{\tau}(t, u, z) \text { exists for a.a. } t \in(0, \mathrm{~T}) \text {, and satisfies }  \tag{65}\\
\left|\partial_{t} \mathcal{E}_{\tau}(t, u, z)\right| \leq \tilde{c}\left(\mathcal{E}_{\tau}(t, u, z)+\hat{c}\right)
\end{gather*}
$$

cf. also MR15 Sec. 2] and [RT17a]. The control of the power 65 allows for the application of Gronwall's inequality and thus implies the estimates

$$
\begin{align*}
\mathcal{E}_{\tau}\left(t_{2}, u, z\right) & \leq\left(\mathcal{E}_{\tau}\left(t_{1}, u, z\right)+\hat{c}\right) \exp \left(\tilde{c}\left(t_{2}-t_{1}\right)\right)-\hat{c},  \tag{66a}\\
\left|\partial_{t} \mathcal{E}_{\tau}\left(t_{2}, u, z\right)\right| & \leq \tilde{c}\left(\mathcal{E}_{\tau}\left(t_{1}, u, z\right)+\hat{c}\right) \exp \left(\tilde{c}\left(t_{2}-t_{1}\right)\right) \tag{66b}
\end{align*}
$$

for all $t_{1}<t_{2} \in[0, \mathbf{T}]$ and $(u, z) \in \mathbf{U} \times \mathbf{X}$ with $\mathcal{E}(0, u, z)<\infty$. This also provides the absolute continuity of the map $t \mapsto \mathcal{E}(t, u, z)$.
Indeed, it can be checked that assumptions (17) on $f$ allow it to prove for the linear interpolant $f_{\tau}$ constructed by (43) that the control of the power 65 is satisfied, analogously to e.g. Rou06, (8.72), (8.73), pp. 219-220].

Uniform bound on the energy based on 47d): Based on the above ideas we now deduce the uniform bound on the energy following the lines of [MR15, Sec. 2]. For this we observe that estimate 64] together with 66b provides

$$
\begin{align*}
& \mathcal{K}\left(\mathrm{D}_{\tau} u_{\tau}^{k}\right)+\mathcal{E}_{\tau}\left(t_{\tau}^{k}, u_{\tau}^{k}, z_{\tau}^{k}\right)+\tau\left(2 \mathcal{V}\left(z_{\tau}^{k} ; \mathrm{D}_{\tau} u_{\tau}^{k}\right)+2 \mathcal{R}_{M \tau}\left(\mathrm{D}_{\tau} z_{\tau}^{k}\right)\right) \\
& \leq \\
& \leq \mathcal{K}\left(\mathrm{D}_{\tau} u_{\tau}^{k-1}\right)+\mathcal{E}_{\tau}\left(t_{\tau}^{k-1}, u_{\tau}^{k-1}, z_{\tau}^{k-1}\right)-\tau\left\langle\mathrm{D}_{\tau} f_{\tau}^{k}, u_{\tau}^{k-1}\right\rangle_{\mathbf{U}^{*}, \mathbf{U}} \\
& \leq \mathcal{K}\left(\mathrm{D}_{\tau} u_{\tau}^{k-1}\right)+\mathcal{E}_{\tau}\left(t_{\tau}^{k-1}, u_{\tau}^{k-1}, z_{\tau}^{k-1}\right)+\int_{t_{\tau}^{k-1}}^{t_{\tau}^{k}} \partial_{t} \mathcal{E}_{\tau}\left(s, u_{\tau}^{k-1}, z_{\tau}^{k-1}\right) \mathrm{d} s \\
& \leq \mathcal{K}\left(\mathrm{D}_{\tau} u_{\tau}^{k-1}\right)+\mathcal{E}_{\tau}\left(t_{\tau}^{k-1}, u_{\tau}^{k-1}, z_{\tau}^{k-1}\right)  \tag{67}\\
& \\
& \quad+\int_{t_{\tau}^{k-1} t_{\tau}^{k}}^{\tilde{c}\left(\mathcal{E}_{\tau}\left(t_{\tau}^{k-1}, u_{\tau}^{k-1}, z_{\tau}^{k-1}\right)+\hat{c}\right) \exp \left(\tilde{c}\left(s-t_{\tau}^{k-1}\right)\right) \mathrm{d} s} \begin{array}{l}
\leq \mathcal{K}\left(\mathrm{D}_{\tau} u_{\tau}^{k-1}\right)+\mathcal{E}_{\tau}\left(t_{\tau}^{k-1}, u_{\tau}^{k-1}, z_{\tau}^{k-1}\right) \\
\quad+\left(\mathcal{K}\left(\mathrm{D}_{\tau} u_{\tau}^{k-1}\right)+\mathcal{E}_{\tau}\left(t_{\tau}^{k-1}, u_{\tau}^{k-1}, z_{\tau}^{k-1}\right)+\hat{c}\right)\left(\exp \left(\tilde{c}\left(t_{\tau}^{k}-t_{\tau}^{k-1}\right)\right)-1\right) \\
=\left(\mathcal{K}\left(\mathrm{D}_{\tau} u_{\tau}^{k-1}\right)+\mathcal{E}_{\tau}\left(t_{\tau}^{k-1}, u_{\tau}^{k-1}, z_{\tau}^{k-1}\right)+\hat{c}\right) \exp \left(\tilde{c}\left(t_{\tau}^{k}-t_{\tau}^{k-1}\right)\right)-\hat{c}
\end{array}
\end{align*}
$$

By recursion we thus conclude for all $k \in\left\{1, \ldots, N_{\tau}\right\}$

$$
\begin{align*}
& \mathcal{K}\left(\mathrm{D}_{\tau} u_{\tau}^{k}\right)+\mathcal{E}_{\tau}\left(t_{\tau}^{k}, u_{\tau}^{k}, z_{\tau}^{k}\right)+\hat{c} \\
& \leq\left(\mathcal{K}\left(\mathrm{D}_{\tau} u_{\tau}^{0}\right)+\mathcal{E}_{\tau}\left(t_{\tau}^{0}, u_{\tau}^{0}, z_{\tau}^{0}\right)+\hat{c}\right) \Pi_{j=1}^{k} \exp \left(\tilde{c}\left(t_{\tau}^{k}-t_{\tau}^{k-1}\right)\right)  \tag{68}\\
& \leq\left(\mathcal{K}\left(\mathrm{D}_{\tau} u_{\tau}^{0}\right)+\mathcal{E}_{\tau}\left(t_{\tau}^{0}, u_{\tau}^{0}, z_{\tau}^{0}\right)+\hat{c}\right) \exp (\tilde{c} T)
\end{align*}
$$

Exploiting cancellations we also find for all $k \in\left\{1, \ldots, N_{\tau}\right\}$

$$
\begin{align*}
& \mathcal{K}\left(\mathrm{D}_{\tau} u_{\tau}^{k}\right)+\mathcal{E}_{\tau}\left(t_{\tau}^{k}, u_{\tau}^{k}, z_{\tau}^{k}\right)+\hat{c}+\sum_{j=1}^{k} \tau\left(2 \mathcal{V}\left(z_{\tau}^{j} ; \mathrm{D}_{\tau} u_{\tau}^{j}\right)+2 \mathcal{R}_{M \tau}\left(\mathrm{D}_{\tau} z_{\tau}^{j}\right)\right)  \tag{69}\\
& \leq\left(\mathcal{K}\left(\mathrm{D}_{\tau} u_{\tau}^{0}\right)+\mathcal{E}_{\tau}\left(t_{\tau}^{0}, u_{\tau}^{0}, z_{\tau}^{0}\right)+\hat{c}\right) \exp (\tilde{c} T) \leq \tilde{C}
\end{align*}
$$

with some positive constant $\tilde{C}>0$ independent of $\tau, M$ thanks to the assumptions on the external loading 17 and on the initial data required in Prop. 4.2

A priori estimates (48): The uniform bound (69) puts us in the position to verify the a priori estimates (48). To this end, note that

$$
\begin{equation*}
0 \leq \frac{\ell}{2}\left\|\nabla z_{\tau}^{k}\right\|_{L^{2}(\Omega)}^{2}+\int_{\Omega} \frac{1}{2 \ell}\left(1-z_{\tau}^{k}\right)^{2} \mathrm{~d} x \leq \frac{\ell}{2}\left\|\nabla z_{\tau}^{k}\right\|_{L^{2}(\Omega)}^{2}+\frac{1}{2 \ell} \mathcal{L}^{d}(\Omega) \tag{70}
\end{equation*}
$$

for all $k \in\left\{1, \ldots, N_{\tau}\right\}$ thanks to 41. Being non-negative, these terms can be neglected on the left-hand side of 69) for the derivation of the uniform bounds related to the displacements. For this, coercivity estimate 15 b and the application of Korn's and Young's inequality together with the boundedness of $f$ from 17a allows us to find constants $c>0, \varepsilon \in(0,1)$, $\hat{C}>0$ such that

$$
\begin{align*}
& c(1-\varepsilon)\left\|u_{\tau}^{k}\right\|_{\mathbf{U}}^{2} \\
& \leq \mathcal{K}\left(\mathrm{D}_{\tau} u_{\tau}^{k}\right)+\mathcal{E}_{\tau}\left(t_{\tau}^{k}, u_{\tau}^{k}, z_{\tau}^{k}\right)+\hat{c} \\
& \quad+\quad \sum_{j=1}^{k} \tau\left(2 \mathcal{V}\left(z_{\tau}^{j} ; \mathrm{D}_{\tau} u_{\tau}^{j}\right)+2 \mathcal{R}_{M \tau}\left(\mathrm{D}_{\tau} z_{\tau}^{j}\right)\right)+\frac{1}{c \varepsilon}\left\|f_{\tau}\right\|_{C\left([0, T], \mathbf{U}^{*}\right)}^{2}  \tag{71}\\
& \leq \hat{C}\left(1+\|f\|_{C\left([0, T], \mathbf{U}^{*}\right)}^{2}\right) \leq C
\end{align*}
$$

for all $k \in\left\{0, \ldots, N_{\tau}\right\}$. This yields the uniform bound 48a) on $\bar{u}_{\tau}, \underline{u}_{\tau}$. Thanks to this we also read from 71] the bound on the kinetic energy, which implies (48b because of $\rho>0$ and the definition of the interpolants. Again by the definition of the interpolants estimate (71) also provides that

$$
\begin{equation*}
c_{\mathbb{D}}^{0} \int_{0}^{T} \int_{\Omega}\left|e\left(\dot{u}_{\tau}\right)\right|^{2} \mathrm{~d} x \mathrm{~d} r \leq \sum_{j=1}^{N_{\tau}} \tau\left(2 \mathcal{V}\left(z_{\tau}^{j} ; \mathrm{D}_{\tau} u_{\tau}^{j}\right)+2 \mathcal{R}_{M \tau}\left(\mathrm{D}_{\tau} z_{\tau}^{j}\right)\right) \leq C, \tag{72}
\end{equation*}
$$

where we used that $\mathcal{R}_{M \tau}\left(\mathrm{D}_{\tau} z_{\tau}^{j}\right) \geq 0$ and the positive definiteness (15a) of $\mathbb{D}$. Noting that (48a) implies that $\left\|u_{\tau}(t)\right\|_{\mathbf{U}} \leq$ $C$ for all $t \in[0, \mathrm{~T}]$ by the definition of the interpolants, estimate 72 leads with 48b to 48c.
We now verify the bound 48d by a comparison argument. For this, we test the discrete momentum balance 38b by functions $v \in C^{0}([0, \mathrm{~T}], \mathbf{U})$. We estimate for $\mathrm{D}_{\tau} \dot{u}_{\tau}(t)=\mathrm{D}_{\tau}^{2} u_{\tau}^{k}$ for $t \in\left(t_{\tau}^{k-1}, t_{\tau}^{k}\right]$ that

$$
\begin{align*}
& \left\|\rho \mathrm{D}_{\tau} \dot{u}_{\tau}\right\|_{L^{2}\left(0, \mathbf{T} ; \mathbf{U}^{*}\right)}=\sup _{\substack{v \in C^{0}([0, \mathbf{T}] ; \mathbf{U}) \\
\|v\|_{L^{2}(0, \mathbf{T} ; \mathbf{U})}=1}} \int_{0}^{\mathrm{T}} \int_{\Omega} \rho \mathrm{D}_{\tau} \dot{u}_{\tau}(t) \cdot v(t) \mathrm{d} x \mathrm{~d} t \\
& \leq \sup _{\substack{v \in C^{0}([0, \mathbf{T}] ; \mathbf{U}) \\
\|v\|_{L^{2}(0, \mathbf{T} ; \mathbf{U})}}} \int_{0}^{\mathrm{T}}\left|\left\langle\mathrm{D}_{u} \overline{\mathcal{E}}_{\tau}\left(t, \bar{u}_{\tau}(t), \bar{z}_{\tau}(t)\right)+\mathrm{D} \mathcal{V}\left(\bar{z}_{\tau} ; \dot{u}_{\tau}(t)\right), v(t)\right\rangle_{\mathbf{U}^{*}, \mathbf{U}}\right| \mathrm{d} t  \tag{73}\\
& \leq\left\|\mathbb{C}\left(\bar{z}_{\tau}\right) e\left(\bar{u}_{\tau}\right)\right\|_{L^{2}\left(0, \mathbf{T} ; L^{2}(\Omega)\right)}+\left\|\mathbb{D}\left(\bar{z}_{\tau}\right) e\left(\dot{u}_{\tau}\right)\right\|_{L^{2}\left(0, \mathbf{T} ; L^{2}(\Omega)\right)}+\left\|\bar{f}_{\tau}\right\|_{L^{2}\left(0, \mathbf{T} ; \mathbf{U}^{*}\right)} \\
& \leq c_{\mathbb{C}}^{*}\left\|\bar{u}_{\tau}\right\|_{L^{2}(0, \mathbf{T} ; \mathbf{U})}+c_{\mathbb{D}}^{*}\left\|\dot{u}_{\tau}\right\|_{L^{2}(0, \mathbf{T} ; \mathbf{U})}+\left\|\bar{f}_{\tau}\right\|_{L^{2}\left(0, \mathbf{T} ; \mathbf{U}^{*}\right)} \leq \hat{C},
\end{align*}
$$

where we used the growth property 15 of $\mathbb{C}, \mathbb{D}$, the assumptions 17 on the loading, and the already deduced estimates (48a) and 48c. This proves the bound (48d) thanks to the density of $C^{0}([0, \mathrm{~T}] ; \mathbf{U})$ in $L^{2}(0, \mathrm{~T} ; \mathbf{U})$.
We also observe that the bound (48e) on $\bar{z}_{\tau}$ and $\underline{z}_{\tau}$ now directly follows from 70 and 71 . The bound 48f) on the time derivative $\dot{z}_{\tau}$ follows from the bound on the viscous dissipation potential $\int_{0}^{\top} M\left\|\dot{z}_{\tau}(t)\right\|_{L^{2}(\Omega)}^{2} \mathrm{~d} t \leq \int_{0}^{\top} 2 \mathcal{R}_{M \tau}\left(\dot{z}_{\tau}(t)\right) \mathrm{d} t \leq$ $C$ provided by 72 when taking into account the definition of the interpolants; we point out the dependence on the viscous parameter $M$. The bound (48ff together with 48e also yields 48g.

We now turn to the last two bounds 48h] and 48i, which remain active even if $M \rightarrow 0$ and thus allow us to deduce a rate-independent evolution for the phase-field variable in the limit. We start with 48h]: The uniform bound on the viscous dissipation given by 72 implies

$$
\begin{equation*}
C \geq \frac{N_{\tau}}{2}\left\|\left(\mathrm{D}_{\tau} z_{\tau}\right)_{+}\right\|_{L^{2}([0, \mathrm{~T}] \times \Omega)}^{2} \geq \frac{\mathrm{T}}{2 \tau \mathcal{L}^{d+1}([0, \mathrm{~T}] \times \Omega)^{2}}\left\|\left(\mathrm{D}_{\tau} z_{\tau}\right)_{+}\right\|_{L^{1}([0, \mathrm{~T}] \times \Omega)}^{2} \tag{74}
\end{equation*}
$$

where we applied Hölder's inequality and used that $N_{\tau}=\frac{\mathrm{T}}{\tau}$. Taking the square root and making use of the definition of $\mathrm{D}_{\tau} z_{\tau}$ we deduce that

$$
\begin{equation*}
\mathcal{L}^{d+1}([0, \mathrm{~T}] \times \Omega) \sqrt{\frac{2 C \tau}{\mathrm{~T}}} \geq\left\|\left(\mathrm{D}_{\tau} z_{\tau}\right)_{+}\right\|_{L^{1}([0, \mathrm{~T}] \times \Omega)}=\sum_{k=1}^{N_{\tau}}\left\|\left(z_{\tau}^{k}-z_{\tau}^{k-1}\right)_{+}\right\|_{L^{1}(\Omega)} \tag{75}
\end{equation*}
$$

Hence, we have a control on $\bar{z}_{\tau}$ where the damage evolves in the "wrong" direction, i.e., where it increases.
Next, we expand the quadratic lower order term $\frac{1}{2 \ell}(1-z)^{2}=\frac{1}{2 \ell}\left(z^{2}+1\right)-\frac{1}{\ell} z$ and use the linear contribution to deduce an $L^{1}$-estimate that depends on the parameter $\ell$ but not on $M$. In this way we obtain

$$
\begin{aligned}
C \geq \int_{\Omega} z_{\tau}^{0}-z_{\tau}^{\top} d x & =\sum_{k=1}^{N_{\tau}} \int_{\Omega} z_{\tau}^{k-1}-z_{\tau}^{k} \mathrm{~d} x \\
& =\sum_{k=1}^{N_{\tau}}\left(\int_{\left\{z_{\tau}^{k-1} \geq z_{\tau}^{k}\right\}}\left|z_{\tau}^{k-1}-z_{\tau}^{k}\right| \mathrm{d} x-\int_{\left\{z_{\tau}^{k-1}<z_{\tau}^{k}\right\}}\left|z_{\tau}^{k-1}-z_{\tau}^{k}\right| \mathrm{d} x\right)
\end{aligned}
$$

Together with 75 this implies

$$
\begin{aligned}
& \sum_{k=1}^{N_{\tau}} \int_{\Omega}\left|z_{\tau}^{k-1}-z_{\tau}^{k}\right| \mathrm{d} x \\
& =\sum_{k=1}^{N_{\tau}}\left(\int_{\left\{z_{\tau}^{k-1} \geq z_{\tau}^{k}\right\}}\left|z_{\tau}^{k-1}-z_{\tau}^{k}\right| \mathrm{d} x+\int_{\left\{z_{\tau}^{k-1}<z_{\tau}^{k}\right\}}\left|z_{\tau}^{k-1}-z_{\tau}^{k}\right| \mathrm{d} x\right) \\
& \leq C+2 \sum_{k=1}^{N_{\tau}} \int_{\left\{z_{\tau}^{k-1}<z_{\tau}^{k}\right\}}\left|z_{\tau}^{k-1}-z_{\tau}^{k}\right| \mathrm{d} x \leq C+2 \mathcal{L}^{d+1}([0, \mathrm{~T}] \times \Omega) \sqrt{\frac{2 C \tau}{\mathrm{~T}}}
\end{aligned}
$$

Hence, the pointwise variation of $\bar{z}_{\tau}$ in time with values in $L^{1}(\Omega)$ is uniformly bounded and thus 48h follows as well as (48i) by definition of the affine linear interpolants $z_{\tau}$.

## 5 Limit passage from the time-discrete to the time-continuous setting

In this section we discuss the limit passage $\tau \rightarrow 0$ starting out from tuples of interpolated time-discrete solutions $\left(\bar{u}_{\tau}, \underline{u}_{\tau}, u_{\tau}, \bar{z}_{\tau}, \underline{z}_{\tau}, z_{\tau}\right)_{\tau}$ of problem (47).
In the case that also $M \rightarrow 0$ we obtain a solution of system $\left(\mathbf{U}, \mathbf{W}, \mathbf{Z}, \mathcal{V}, \mathcal{K}, \mathcal{R}_{1}, \mathcal{E}\right)$, more precisely we deduce the following

Theorem 5.1 (Existence of solutions in the rate-independent limit). Let the assumptions of Theorem 4.1 and Proposition 4.2 be satisfied, and assume that the one-sided variational inequality 10a holds true at time $t=0$ for the initial data $\left(u_{0}, z_{0}\right) \in \mathbf{U} \times \mathbf{X}$. Consider the viscosity parameter $M=M(\tau)>0$ in (4) to depend on $\tau$ such that $M(\tau) \rightarrow 0$ as $\tau \rightarrow 0$. For all $\tau>0$ let $\left(\bar{u}_{\tau}, \underline{u}_{\tau}, u_{\tau}, \bar{z}_{\tau}, \underline{z}_{\tau}, z_{\tau}\right)$ be a tuple of interpolated solutions of problem 47) corresponding to system

$$
\left(\mathbf{U}, \mathbf{W}, \mathbf{Z}_{M}, \mathcal{V}, \mathcal{K}, \mathcal{R}_{M}, \mathcal{E}\right) .
$$

Then the following results hold true:

1 Then, there exist functions $u:[0, \mathrm{~T}] \rightarrow \mathbf{U}, z:[0, \mathrm{~T}] \rightarrow \mathbf{X}$ such that following convergence statements are valid:

$$
\begin{align*}
\bar{u}_{\tau}, \underline{u}_{\tau} \stackrel{*}{\rightharpoonup} u & \text { weakly-* in } L^{\infty}(0, \mathrm{~T} ; \mathbf{U}),  \tag{76a}\\
u_{\tau} \rightharpoonup u & \text { weakly in } H^{1}(0, \mathrm{~T} ; \mathbf{U}),  \tag{76b}\\
\dot{u}_{\tau} \stackrel{*}{\rightharpoonup} \dot{u} & \text { weakly-* in } L^{\infty}\left(0, \mathrm{~T} ; L^{2}\left(\Omega, \mathbb{R}^{d}\right)\right),  \tag{76c}\\
\bar{u}_{\tau}(t), \underline{u}_{\tau}(t) \rightharpoonup u(t) & \text { weakly in } \mathbf{U} \text { for all } t \in[0, \mathrm{~T}],  \tag{76d}\\
\dot{u}_{\tau}(t) \rightharpoonup \dot{u}(t) & \text { weakly in } L^{2}\left(\Omega, \mathbb{R}^{d}\right) \text { for all } t \in[0, \mathrm{~T}],  \tag{76e}\\
\bar{z}_{\tau}(t), \underline{z}_{\tau}(t) \rightharpoonup z(t) & \text { weakly in } \mathbf{X} \text { for all } t \in[0, \mathrm{~T}],  \tag{76f}\\
\bar{z}_{\tau}(t), \underline{z}_{\tau}(t) \rightarrow z(t) & \text { strongly in } L^{2}(\Omega) \text { for all } t \in[0, \mathrm{~T}],  \tag{76g}\\
\bar{z}_{\tau}, \underline{z}_{\tau} \stackrel{*}{\not} z & \text { weakly-* in } L^{\infty}(0, \mathrm{~T} ; \mathbf{X}) . \tag{76h}
\end{align*}
$$

2 The limit pair $(u, z)$ is a solution of $(\mathbf{U}, \mathbf{W}, \mathbf{Z}, \mathcal{V}, \mathcal{K}, \mathcal{R}, \mathcal{E})$ in the sense of Definition 1.3 and it is $0 \leq z(t, x) \leq 1$ for a.a. $x \in \Omega$ and for all $t \in[0, \mathrm{~T}]$. In addition, the limit $(u, z)$ also satisfies semistablility inequality (11) for a.e. $t \in(0, \mathrm{~T})$.
3 The limit function $u$ has the following regularity:

$$
\begin{gather*}
u \in H^{1}(0, \mathrm{~T} ; \mathbf{U}) \cap L^{\infty}(0, \mathrm{~T} ; \mathbf{U}) \cap W^{1, \infty}\left(0, \mathrm{~T} ; L^{2}(\Omega)\right) \cap C^{0}([0, \mathrm{~T}] ; \mathbf{U}),  \tag{77a}\\
\ddot{u} \in L^{2}\left(0, \mathrm{~T} ; \mathbf{U}^{*}\right), \quad \text { and }  \tag{77b}\\
\int_{s}^{t}\langle\ddot{u}(r), \dot{u}(r)\rangle \mathrm{d} r=\frac{1}{2}\|\dot{u}(t)\|_{L^{2}\left(\Omega ; \mathbb{R}^{d}\right)}^{2}-\frac{1}{2}\|\dot{u}(s)\|_{L^{2}\left(\Omega ; \mathbb{R}^{d}\right)}^{2} \text { for all } s, t \in[0, \mathrm{~T}], \tag{77c}
\end{gather*}
$$

and, in addition to the regularity $z \in B V\left(0, \mathrm{~T} ; L^{1}(\Omega)\right) \cap L^{\infty}(0, \mathrm{~T} ; \mathbf{X})$ the limit function $z$ even satisfies:

$$
\begin{equation*}
z \in C^{0,1 / 4}([0, \mathbf{T}) ; \mathbf{X}), \tag{78}
\end{equation*}
$$

i.e., $z:[0, \mathbf{T}) \rightarrow \mathbf{X}$ is Hölder-continuous with Hölder-exponent $h=1 / 4$. Hence, $(u, z)$ satisfies the onesided variational inequality [10a, semistability inequality [11, and the energy-dissipation balance 10d) even for all $t \in[0, \mathrm{~T})$.
4 In addition to convergence results 76] also the following improved convergences hold true:

$$
\begin{align*}
e\left(\dot{u}_{\tau}\right) \rightarrow e(\dot{u}) & \text { strongly in } H^{1}(0, T ; \mathbf{U}),  \tag{79a}\\
e\left(\bar{u}_{\tau}(t)\right) \rightarrow e(u(t)) & \text { strongly in } \mathbf{U} \text { for all } t \in[0, \mathrm{~T}),  \tag{79b}\\
\bar{z}_{\tau}(t) \rightarrow z(t) & \text { strongly in } \mathbf{X} \text { for all } t \in[0, \mathrm{~T}) . \tag{79c}
\end{align*}
$$

Proof. The proof of the convergence results 76 will be developed in Section 5.1 Subsequently the limit passage in the defining properties of the solutions, cf. Def. 1.3 properties (10), is carried out in Section 5.2 The regularity (77) of $u$ will be discussed in Sec. 5.2 .2 when passing to the limit in the weak momentum balance. The Hölder-continuity of $z:[0, \mathrm{~T}) \rightarrow \mathbf{X}$ is developed in Sec. 5.3 and it relies on a general regularity result stated here below in Theorem 5.2. The continuity of $(u, z)$ in time allows it to conclude that the defining properties 10a, 11, and 10d are valid even for all $t \in[0, \mathrm{~T})$. Based on this, the improved convergences 79 are concluded in Section 5.4

The proof of the temporal Hölder-continuity of $z$ relies on an adaption of a general regularity result for coupled rate-dependent/rate-independent systems obtained in RT17a Thm. 3.8]. Let us point out that for purely rate-independent systems temporal (Hölder-) continuity stems from enhanced convexity properties of the energy functional for the pair $(u, z)$, cf. MT04 TM10 for more details. For damage models as in the current situation the energy functional is separately convex, only, so that improved temporal regularity cannot be expected in a purely rate-independent setting. As can be seen here in Theorem 5.2 in the coupled rate-dependent/rate-independent setting it is sufficient to have uniform convexity with respect to the rate-independent variable $z$, because the good regularity of the rate-dependent variable $u$ partially carries over to $z$ through estimates 90) or 91. In case of a unidirectional evolution of $z$ as for damage it is even sufficient to have such estimates available for a.e. $t \in(0, \mathrm{~T})$, only, because the information missing on a null-set $N \subset[0, \mathrm{~T})$ is filled by unidirectionality to ultimately conclude regularity statement 78 ; see Sec . 5.3 for more details.

Theorem 5.2 (Adaption of RT17a Thm. 3.8]). Let (U,W,Z, $\mathcal{V}, \mathcal{K}, \mathcal{R}, \mathcal{E})$ be a damped inertial system characterized by Banach spaces $\mathbf{U}, \mathbf{Z}$, and a Hilbert space $\mathbf{W}$, the kinetic energy $\mathcal{K}: \mathbf{W} \rightarrow[0, \infty)$, a dissipation potential $\mathcal{V}$ : $\mathbf{Z} \times \mathbf{U} \rightarrow[0, \infty)$, a positively 1-homogeneous dissipation potential $\mathcal{R}: \mathbf{Z} \rightarrow[0, \infty]$, and an energy functional $\mathcal{E}:[0, \mathrm{~T}] \times \mathbf{U} \times \mathbf{Z} \rightarrow \mathbb{R} \cup\{\infty\}$ such that for all $t \in[0, \mathrm{~T}]$ the functional $\mathcal{E}(t, \cdot, \cdot)$ takes finite values on (a closed, convex subset $\mathrm{D}_{u} \times \mathrm{D}_{z}$ of) $\mathbf{V} \times \mathbf{X}$ with $\mathbf{X}$ a Banach space such that $\mathbf{X} \subset \mathbf{Z}$ compactly and $\mathbf{V}$ a Banach space such that $\mathbf{V} \subset \mathbf{U}$ continuously and densely. Further consider the following list of assumptions:
A1) The pair $(u, z):[0, \mathbf{T}] \rightarrow \mathbf{U} \times \mathbf{Z}$ satisfies a semistability inequality for a.a. $t \in[0, \mathbf{T}]$ :

$$
\begin{equation*}
\mathcal{E}(t, u(t), z(t)) \leq \mathcal{E}(t, u(t), \tilde{z})+\mathcal{R}(\tilde{z}-z(t)) \quad \text { for all } \tilde{z} \in \mathbf{Z} \tag{80}
\end{equation*}
$$

Accordingly, define the $\mathcal{L}^{1}$-null set

$$
\begin{equation*}
N:=\{\hat{t} \in[0, \mathrm{~T}],(u(\hat{t}), z(\hat{t})) \text { does not satisfy semistability (80) }\} . \tag{81}
\end{equation*}
$$

A2) The pair $(u, z):[0, \mathrm{~T}] \rightarrow \mathbf{U} \times \mathbf{Z}$ satisfies the following upper energy-dissipation estimate

$$
\begin{align*}
\mathcal{K}(\dot{u}(t)) & +\mathcal{E}(t, u(t), z(t))+\mathcal{R}(z(t)-z(s))+\int_{s}^{t} 2 \mathcal{V}(z(r) ; \dot{u}(r)) \mathrm{d} r \\
& \leq \mathcal{K}(\dot{u}(s))+\mathcal{E}(t, u(s), z(s))+\int_{s}^{t} \partial_{r} \mathcal{E}(r, u(r), z(r)) \mathrm{d} r \tag{82}
\end{align*}
$$

for all subintervals $[s, t] \subset[0, \mathrm{~T}]$ with $s, t \in[0, \mathrm{~T}] \backslash N$.
A3) $u \in W^{2,2}\left(0, \mathrm{~T} ; \mathbf{U}^{*}\right) \cap H^{1}(0, \mathrm{~T} ; \mathbf{U})$ and $t \mapsto\left|\langle\ddot{u}(t), \dot{u}(t)\rangle_{\mathbf{U}}\right| \in L^{1}(0, \mathrm{~T})$.
A4) The energy functional $\mathcal{E}$ complies with the following power control: There are constants $\tilde{c}, \hat{c}$ such that for all $(u, z) \in$ $\mathbf{U} \times \mathbf{Z}$ with $\mathcal{E}(0, u, z)<\infty$ it is $\mathcal{E}(\cdot, u, z) \in W^{1,1}(0, \mathrm{~T}), \partial_{t} \mathcal{E}(t, u, z)$ exists for a.a. $t \in(0, \mathrm{~T})$, and satisfies

$$
\begin{equation*}
\left|\partial_{t} \mathcal{E}(t, u, z)\right| \leq \tilde{c}(\mathcal{E}(t, u, z)+\hat{c}) \tag{83}
\end{equation*}
$$

A5) The functional $\mathcal{E}(t, u, \cdot): \mathrm{D}_{z} \rightarrow \mathbb{R}$ is Gâteaux-differentiable and uniformly convex, i.e.,

$$
\begin{align*}
& \exists \alpha \geq 2 \exists C_{\star}>0 \forall t \in[0, \mathrm{~T}], \forall\left(u, z_{0}\right),\left(u, z_{1}\right) \in \mathrm{D}_{u} \times \mathrm{D}_{z}, \forall \lambda \in[0,1] \\
& \text { setting } z_{\lambda}:=\lambda z_{1}+(1-\lambda) z_{0}:  \tag{84}\\
& \quad \mathcal{E}\left(t, u, z_{\lambda}\right)+C_{\star} \lambda(1-\lambda)\left\|z_{1}-z_{0}\right\|_{\mathbf{S}}^{\alpha} \leq \lambda \mathcal{E}\left(t, u, z_{1}\right)+(1-\lambda) \mathcal{E}\left(t, u, z_{0}\right)
\end{align*}
$$

with $\mathbf{S}$ a Banach space such that $\mathbf{X} \subseteq \mathbf{S}$ continuously, that may or may not coincide with $\mathbf{X}$ or $\mathbf{Z}$.
A6) The functional $\mathcal{E}(t, \cdot, z): \mathbf{U} \rightarrow \mathbb{R} \cup\{\infty\}$ is Hölder-continuous, i.e., there are constants $c_{\star}>0, \beta_{u} \in(0,1]$ such that for all $s, t \in[0, \mathrm{~T}]$ and for all $\left(u_{0}, z_{1}\right),\left(u_{1}, z_{1}\right)$ with $\sup _{t \in[0, \mathrm{~T}]} \mathcal{E}\left(t, u_{i}, z_{1}\right) \leq E, i \in\{0,1\}$ we have

$$
\begin{equation*}
\left|\mathcal{E}\left(t, u_{1}, z_{1}\right)-\mathcal{E}\left(t, u_{0}, z_{1}\right)\right| \leq c_{\star}\left\|u_{1}-u_{0}\right\|_{\mathbf{U}}^{\beta_{u}} \tag{85}
\end{equation*}
$$

A7) The functional $\mathcal{E}(t, \cdot, z): \mathrm{D}_{u} \rightarrow \mathbb{R}$ is Gâteaux-differentiable for all $(t, z) \in[0, \mathrm{~T}] \times \mathrm{D}_{z}$.
A8) The functional $\mathcal{E}(t, \cdot, z): \mathrm{D}_{u} \rightarrow \mathbb{R}$ complies with the following gradient estimate: There exist constants $\hat{C}_{1}, \hat{C}_{2}$, $\hat{C}_{3}>0$ and $\sigma \in[1, \infty)$ such that

$$
\begin{equation*}
\left\|\mathrm{D}_{u} \mathcal{E}(t, u, z)\right\|_{\mathbf{U}^{*}}^{\sigma} \leq \hat{C}_{1} \mathcal{E}(t, u, z)+\hat{C}_{2}\|u\|_{\mathbf{U}}+\hat{C}_{3} \tag{86}
\end{equation*}
$$

for all $(t, u, z) \in[0, \mathbf{T}] \times \mathbf{U} \times \mathbf{X}$ with $\mathcal{E}(t, u, z)<\infty$.
A9) The pair $(u, z):[0, \mathrm{~T}] \rightarrow \mathbf{U} \times \mathbf{Z}$ satisfies the weak momentum balance for all $t \in[0, \mathrm{~T}]$ :

$$
\begin{equation*}
\rho \ddot{u}(t)+\mathrm{D}_{u} \mathcal{E}(t, u(t), z(t))+\mathrm{D}_{\dot{u}} \mathcal{V}(z(t) ; \dot{u}(t))=0 \quad \text { in } \mathbf{U}^{*} . \tag{87}
\end{equation*}
$$

A10) The dissipation potential $\mathcal{V}: \mathbf{Z} \times \mathbf{U} \rightarrow[0, \infty)$ has quadratic growth, i.e., there are constants $\tilde{C}_{1}, \tilde{C}_{2}>0$ such that for all $(z, v) \in \mathbf{Z} \times \mathbf{U}$

$$
\begin{equation*}
\mathcal{V}(z ; v) \geq \tilde{C}_{1}\|v\|_{\mathbf{U}}^{2}-\tilde{C}_{2} \tag{88}
\end{equation*}
$$

The following statements hold true:
1 Let assumptions A1) and A5) be valid. Then ( $u, z)$ satisfies the following improved semistability inequality

$$
\begin{equation*}
\mathcal{E}(s, u(s), z(s))+C_{\star}\|z(t)-z(s)\|_{\mathbf{S}}^{\alpha} \leq \mathcal{E}(s, u(s), z(t))+\mathcal{R}(z(t)-z(s)) \tag{89}
\end{equation*}
$$

for all $s \in[0, \mathrm{~T}] \backslash N$ and for all $t \in[0, \mathrm{~T}]$.
2 Let assumptions A1)-A6) be valid. Then, $z$ complies with the estimate

$$
\begin{equation*}
C_{\star}\|z(t)-z(s)\|_{\mathbf{S}}^{\alpha} \leq C|t-s|+\int_{s}^{t}\left|\langle\rho \ddot{u}(r), \dot{u}(r)\rangle_{\mathbf{U}}\right| \mathrm{d} r+c_{\star}\left(\int_{s}^{t}\|\dot{u}(r)\|_{\mathbf{U}} \mathrm{d} r\right)^{\beta_{u}} \tag{90}
\end{equation*}
$$

for all subintervals $[s, t] \subset[0, \mathrm{~T}]$ with $s, t \in[0, \mathrm{~T}] \backslash N$.
3 Let assumptions A1)-A9) be valid. Then, $z$ complies with the estimate

$$
\begin{equation*}
C_{\star}\|z(t)-z(s)\|_{\mathbf{S}}^{\alpha} \leq C|t-s|+c_{\star}\left(\int_{s}^{t}\|\dot{u}(r)\|_{\mathbf{U}} \mathrm{d} r\right)^{\beta_{u}} \tag{91}
\end{equation*}
$$

for all subintervals $[s, t] \subset[0, \mathrm{~T}]$ with $s, t \in[0, \mathrm{~T}] \backslash N$.
4 Let assumptions A1)- A6) be valid and let A1) and A2) be satisfied for all subintervals $[s, t] \subset\left[s_{*}, t_{*}\right] \subset[0, \mathrm{~T}]$, even for all $s, t \in\left[s_{*}, t_{*}\right]$. Then also estimate (90) is valid even for all $s, t \in\left[s_{*}, t_{*}\right]$ and hence it implies that $z \in C^{0}\left(\left[s_{*}, t_{*}\right] ; \mathbf{S}\right)$.
5 Let assumptions A1)-A9) be valid and let A1) and A2) be satisfied for all subintervals $[s, t] \subset\left[s_{*}, t_{*}\right] \subset[0, \mathrm{~T}]$, even for all $s, t \in\left[s_{*}, t_{*}\right]$. Then also estimate (91) holds true even for all $s, t \in\left[s_{*}, t_{*}\right]$ and thus it implies that $z \in C^{0}\left(\left[s_{*}, t_{*}\right] ; \mathbf{S}\right)$. Additionally assume that A10) is valid. Then

$$
\begin{equation*}
z \in C^{0, h}\left(\left[s_{*}, t_{*}\right] ; \mathbf{S}\right) \text { with the Hölder-exponent } h=\frac{\beta_{u}}{(2 \alpha)}<1 / 2 . \tag{92}
\end{equation*}
$$

Proof. In [RT17a Thm. 3.8] the assumptions A1) and A2) are strengthened to hold for all $s, t \in[0, \mathrm{~T}]$ and consequently it only ensures statements 4 and 5 of above Thm. 5.2 with $\left[s_{*}, t_{*}\right]=[0, \mathrm{~T}]$. Moreover, in [RT17a Thm. 3.8] also assumption A10) on the rate-dependent dissipation is different: There, $\tilde{\mathcal{V}}: \mathbf{U} \rightarrow[0, \infty)$ is independent of the rate-independent variable $z$ but allows for a general $p$-growth with $p>1$ instead of $p=2$ in 88. In this spirit, the viscous dissipation function $\int_{s}^{t} 2 \mathcal{V}(z(r) ; \dot{u}(r)) \mathrm{d} r$ appearing in 82] is replaced in RT17a] by De Giorgi's expression $\int_{s}^{t} \tilde{\mathcal{V}}(\dot{u}(r))+\tilde{\mathcal{V}}^{*}(-(\ddot{u}(r)+$ $\left.\left.\mathrm{D}_{u} \mathcal{E}(r, u(r), z(r))\right)\right) \mathrm{d} r$ which involves the convex conjugate of the convex potential $\tilde{\mathcal{V}}: \mathbf{U} \rightarrow[0, \infty)$. We do not use this expression in 82 due to the quadratic, but $z$-dependent nature of $\mathcal{V}$. A close perusal of the proof of [RT17a Thm. 3.8] reveals that above estimates (89, (90), and 91) can be deduced to hold for all $s, t \in[0, \mathrm{~T}] \backslash N$ under the relaxed assumptions that semistability 11 and the upper energy-dissipation estimate 82 are valid for exactly these $s, t \in[0, \mathrm{~T}] \backslash N$. In this way, also statements 1 and 2 become valid. Moreover, since we here work in the setting of a quadratic, $z$-dependent dissipation $\mathcal{V}: \mathbf{X} \times \mathbf{U} \rightarrow[0, \infty)$ and use the dissipative term $\int_{s}^{t} 2 \mathcal{V}(z(r) ; \dot{u}(r)) \mathrm{d} r$ in 82, certain estimates related to 91 can be carried out differently circumventing $\mathcal{V}^{*}$. In this way, also statement 3 of above Thm. 5.2 can be shown to hold for all $s, t \in[0, \mathrm{~T}] \backslash N$. We also refer to Theorem 6.2 and in particular to estimates 142-157 in its proof, where analogous arguments are carried out in the setting of a viscous dissipation potential $\mathcal{R}_{M}$ for $z$.

Remark 5.3 (Simultaneous limit and its connection to FE-approximations). It is possible to formulate the defining properties [10], resp. 9. of solutions in the sense of Def. 1.3 resp. Def. 1.2 already on the fully discrete level. In this context the Yosida regularization cannot have its full effect such that the discrete damage variable may take values outside of the interval $[0,1]$ on sets of strictly positive measure. This entails that the discrete version of the functional $z \mapsto \int_{\Omega} \frac{1}{2} \mathbb{C}(z) e(u): e(u) \mathrm{d} x$ is non-convex even for fixed displacements $u$. Hence, an upper energy-dissipation estimate holds true only up to an error generated by the non-convexity. In order to find compactness nevertheless, regions of non-convexity have to be controlled. In $\left[B M T^{+} 20\right.$, Section 4] we show that this is indeed possible. Therein, the space discretization is realized with a finite element approximation in terms of P1 finite elements. Here, apart from the error due to the non-convexity also an error caused by only approximately solving the nonlinear phase-field evolution equation 25a becomes relevant. The control of these error terms leads to additional conditions which can be regarded as stopping criteria for an algorithm solving
the discrete problems. Moreover, the control of the non-convexity errors in the upper energy-dissipation estimate leads to a coupling relation between time-step size and mesh-size of the FE-space. We mention that it is also possible to show with an a-posteri argument the existence of a diagonal sequence converging to a solution in the sense of Def. 1.3 see [BMT ${ }^{+}$20 Sec. 4].

### 5.1 Proof of Theorem 5.1, Item 1: Convergence statements 76.

Convergence statements 76a -76e for the displacements: The convergence statements 76a-76c) for $\bar{u}_{\tau}, \underline{u}_{\tau}, u_{\tau}$ and $\dot{u}_{\tau}$ follow by standard compactness arguments from the uniform bounds 48a, 48b], and (48c), at first each of them with a different limit function and it has to be shown that the limits coincide. For this, note that (48c) implies $\left(\dot{u}_{\tau}\right)_{\tau}$ to be uniformly bounded in $L^{2}(0, \mathrm{~T} ; \mathbf{U})$. Then, the identities

$$
\begin{equation*}
u_{\tau}(t)-\bar{u}_{\tau}(t)=\left(t-t_{\tau}^{k}\right) \dot{u}_{\tau}(t) \quad \text { and } \quad u_{\tau}(t)-\underline{u}_{\tau}(t)=\left(t-t_{\tau}^{k-1}\right) \dot{u}_{\tau}(t) \tag{93}
\end{equation*}
$$

allow us to conclude that the limit functions of (76a) and 76b coincide. They also coincide with the limit obtained by convergence (76c) as can be deduced from the uniqueness of weak limits when taking into account 776 b .

For convergences (76d), which hold pointwise for all $t \in[0, \mathrm{~T}]$, we realize that $\left(u_{\tau}\right)_{\tau}$ is uniformly bounded in $B V(0, \mathrm{~T} ; \mathbf{U})$ thanks to the $H^{1}(0, \mathrm{~T} ; \mathbf{U})$-bound from 48c and the continuous embedding of $H^{1}(0, \mathrm{~T} ; \mathbf{U})$ in $B V(0, \mathrm{~T} ; \mathbf{U})$. By the definition of the interpolants we also find that $\left(\bar{u}_{\tau}\right)_{\tau}$ and $\left(\underline{u}_{\tau}\right)_{\tau}$ are uniformly bounded in $B V(0, \mathrm{~T} ; \mathbf{U})$. More precisely, we have the following estimate:

$$
\begin{align*}
\sum_{k=1}^{N_{\tau}}\left\|u_{\tau}^{k}-u_{\tau}^{k-1}\right\|_{\mathbf{U}} & =\sum_{k=1}^{N_{\tau}} \tau\left\|\frac{u_{\tau}^{k}-u_{\tau}^{k-1}}{\tau}\right\|_{\mathbf{U}}=\int_{0}^{\boldsymbol{T}}\left\|\dot{u}_{\tau}(t)\right\|_{\mathbf{U}} \mathrm{d} t  \tag{94}\\
& =\left\|\dot{u}_{\tau}\right\|_{L^{1}(0, \mathbf{T} ; \mathbf{U})} \leq \sqrt{\mathbf{T}}\left\|\dot{u}_{\tau}\right\|_{L^{2}(0, \mathbf{T} ; \mathbf{U})} \leq C
\end{align*}
$$

where the left-hand side of (94) gives the total variation of the interpolants $\bar{u}_{\tau}$ and $\underline{u}_{\tau}$. Then, an application of Helly's theorem for Banach spaces [MT04, Thm. 6.1] allows us to conclude the pointwise convergences in 76d upon extraction of a further subsequence. To conclude that $\left(\bar{u}_{\tau}\right)_{\tau}$ and $\left(\underline{u}_{\tau}\right)_{\tau}$ have the same limit pointwise in time that coincides with $u$ we once more exploit the identities 93 together with the uniqueness of the weak limit already obtained in 76a.

For [76e] we adapt the arguments of [RT17b, p. 1536]. There, the key tool is an Aubin-Lions compactness argument, cf. [Sim87. Cor. 5, p. 86], which now accordingly has to be replaced with a version suited for a time-discretization and piecewise constant sequences in time $\left(\dot{u}_{\tau}\right)_{\tau}$. This time-discrete analogon of the Aubin-Lions lemma is provided by [DJ12] Thm. 1, p. 3073]. For the argument we observe that the spaces $\mathbf{U}=H^{1}\left(\Omega ; \mathbb{R}^{d}\right) \subset L^{2}\left(\Omega ; \mathbb{R}^{d}\right) \subset \mathbf{U}^{*}$ form an evolution triple with $\mathbf{U} \subset L^{2}\left(\Omega ; \mathbb{R}^{d}\right)$ compactly. Hence, by [DJ12, Thm. 1, p. 3073] we conclude that

$$
\begin{equation*}
\dot{u}_{\tau} \rightarrow \dot{u} \quad \text { in } L^{2}\left(0, \mathrm{~T} ; L^{2}(\Omega)\right) \cap C^{0}\left([0, \mathrm{~T}] ; \mathbf{U}^{*}\right) . \tag{95}
\end{equation*}
$$

From this we infer 76 e with the following argument: For all $t \in[0, \mathrm{~T}]$, every subsequence of $\left(\dot{u}_{\tau}(t)\right)_{\tau}$ is bounded in $L^{2}(\Omega)$ and admits a further subsequence weakly converging in $L^{2}(\Omega)$ to some limit $v_{t}$. In view of (95) we have $v_{t}=\dot{u}(t)$ identified in $\mathbf{U}^{*}$ for all $t \in[0, \mathrm{~T}]$. Since the limit does not depend on the extracted subsequence, we conclude $\sqrt{76 e}$.

Convergence statements $776 \mathrm{f}-76 \mathrm{~h}$ for the damage variable: To verify convergence statements $76 \mathrm{76f}-76 \mathrm{~h}]$ we observe that the uniform $B V$-bound [48h] justifies the use of a variant of Helly's Theorem, cf. [MR15, Thm. 2.1.24, p. 72], since $\|\cdot\|_{L^{1}(\Omega)}$ defines a dissipation distance in the sense of [MR15 (D1) and (D2), p. 46]. This provides the existence of an element $z:[0, \mathrm{~T}] \rightarrow \mathbf{X}$ with $z \in B V\left(0, \mathrm{~T} ; L^{1}(\Omega)\right)$ such that, along a (not relabelled) subsequence, $\bar{z}_{\tau}(t) \rightharpoonup z(t) \in \mathbf{X}$ weakly even in $\mathbf{X}$ for all $t \in[0, T]$, which is the first of 76 f . By the compact embedding $\mathbf{X} \subset L^{2}(\Omega)$ we thus obtain the first of 76 g . Thanks to the uniform bound 448 e , we now also conclude that the first of 76 h holds true. Hence, the convergence statements 76f-76h are verified for the sequence $\left(\bar{z}_{\tau}\right)_{\tau}$.

Repeating above arguments for the sequence $\left(\underline{z}_{\tau}\right)_{\tau}$ starting from the uniform $B V$-bound 48h we also find that $\left(\underline{z}_{\tau}\right)_{\tau}$ converges to a limit function $\underline{z}:[0, \mathrm{~T}] \rightarrow \mathbf{X}$ in the topologies of $76 \mathrm{f}-76 \mathrm{~h}$ ) and now it has to be shown that $\underline{z}$ indeed coincides with $z$. For this, we may follow the lines of [LRTT18] p. 1341]. We denote by $J_{z}$ and $J_{\underline{z}}$ the countable jump sets of the two limit functions $z, \underline{z} \in B V\left(0, \mathrm{~T} ; L^{1}(\Omega)\right)$. Let $t \in[0, \mathrm{~T}] \backslash\left(J_{z_{1}} \cup J_{z_{2}}\right)$. By the definition of the interpolants we
have $\bar{z}_{\tau}(t-\tau)=\underline{z}_{\tau}(t)$ for all $\tau>0$ and thus as $\tau \rightarrow 0$ if follows $z(t)=\underline{z}(t)$ for all $t \in[0, \mathrm{~T}] \backslash\left(J_{z_{1}} \cup J_{z_{2}}\right)$. Now, let $t \in J_{z} \cup J_{\underline{z}}$ and w.l.o.g. assume $t \in J_{z}$. Then there are sequences $\left(t_{j}^{+}\right)_{j},\left(t_{j}^{-}\right)_{j} \subset[0, \mathrm{~T}] \backslash\left(J_{z} \cup J_{\underline{z}}\right)$ such that $t_{j}^{+} \searrow t, t_{j}^{-} \nearrow t$. But since $z\left(t_{j}^{ \pm}\right)=\underline{z}\left(t_{j}^{ \pm}\right)$for $t_{j}^{+}, t_{j}^{-} \in[0, \mathrm{~T}] \backslash\left(J_{z} \cup J_{\underline{z}}\right)$, we find for the left limit that $z^{-}(t)=$ $\lim _{j \rightarrow \infty} z\left(t_{j}^{-}\right)=\lim _{j \rightarrow \infty} \underline{z}\left(t_{j}^{-}\right)=\underline{z}^{-}$and for the right limit that $z^{+}(t)=\lim _{j \rightarrow \infty} z\left(t_{j}^{+}\right)=\lim _{j \rightarrow \infty} \underline{z}\left(t_{j}^{+}\right)=\underline{z}^{+}$. This implies that $J_{z}=J_{\underline{z}}$. Thus, $z=\underline{z}$ on the whole interval [ $\left.0, \mathrm{~T}\right]$ and hence convergence results [76f] -76h] are verified.

### 5.2 Proof of Theorem 5.1, Item 2: Defining properties of the solutions and boundedness $z \in$ $[0,1]$

In this section we show that the limit pair $(u, z)$ obtained through convergences 76 indeed is a solution of system $\left(\mathbf{U}, \mathbf{W}, \mathbf{Z}, \mathcal{V}, \mathcal{K}, \mathcal{R}_{1}, \mathcal{E}\right)$ in the sense of Definition 1.3 . For this we will pass to the limit $\tau \rightarrow 0$ in problem 47 for the interpolants $\left(\bar{u}_{\tau}, \underline{u}_{\tau}, u_{\tau}, \bar{z}_{\tau}, \underline{z}_{\tau}, z_{\tau}\right)_{\tau}$ using the convergence results 76 and thus conclude properties 10 . For the limit passage we will also make use of the following convergence results for the interpolants of the external forces:

$$
\begin{align*}
\bar{f}_{\tau} \rightarrow f & \text { strongly in } L^{p}\left(0, \mathrm{~T} ; \mathbf{U}^{*}\right) \text { for all } 1 \leq p<\infty .  \tag{96a}\\
\bar{f}_{\tau} \stackrel{*}{\rightrightarrows} f & \text { weakly-* in } L^{\infty}\left(0, \mathrm{~T} ; \mathbf{U}^{*}\right) .  \tag{96b}\\
\bar{f}_{\tau}(t) \rightarrow f(t) & \text { strongly in } \mathbf{U}^{*} \text { for all } t \in[0, \mathrm{~T}] .  \tag{96c}\\
f_{\tau} \rightarrow f & \text { strongly in } H^{1}\left(0, \mathrm{~T} ; \mathbf{U}^{*}\right) \tag{96d}
\end{align*}
$$

by assumption 17) on the regularity of the external load.
First, it is shown in Section 5.2.1 that $z$ takes values bounded in $[0,1]$ and that it satisfies the unidirectionality property 10b. Subsequently, Section 5.2 .2 is devoted to the limit passage in the weak momentum balance 10 c . We will further verify in Section 5.2 .3 that the one-sided variational inequality 10a is valid for the limit pair $(u, z)$. There, we also show that solutions satisfy the semistability inequality (11). Moreover, Section 5.2.4 establishes the energy dissipation balance 10d.

### 5.2.1 Proof of the boundedness of $z$ and of the unidirectionality of the damage evolution 10 b

We first show the boundedness of $z$, i.e., that

$$
\begin{equation*}
z(t, x) \in[0,1] \text { for a.e. } x \in \Omega \text { and all } t \in[0, \mathrm{~T}] . \tag{97}
\end{equation*}
$$

Indeed, this can be concluded with the knowledge that the time-discrete approximants $\left(\bar{z}_{\tau}\right)_{\tau}$ satisfy $\bar{z}_{\tau}(t, x) \in[0,1]$ for a.e. $x \in \Omega$ and all $t \in[0, \mathrm{~T}]$ by 41 in Theorem 4.1 The strong $L^{2}(\Omega)$-convergence 76 g provides convergence in measure. Hence, assuming that $z(t) \notin[0,1]$ on a set $B \subset \Omega$ of strictly positive measure leads to a contradiction; thus (97) is verified.

Unidirectionality 10b: We verify now that in the time-continuous limit the damage variable has a unidirectional evolution, i.e., for all $t_{1}<t_{2} \in[0, \mathrm{~T}]$ it is $z\left(t_{1}, x\right) \geq z\left(t_{2}, x\right)$ for a.a. $x \in \Omega$, cf. 10b]. For this, assume the contrary, i.e., suppose that $z\left(t_{1}, x\right)<z\left(t_{2}, x\right)$ for a.a. $x \in E$, with $\mathcal{L}^{d}(E)>0$. Hence $\int_{E} z\left(t_{2}\right)-z\left(t_{1}\right) d x=: \alpha>0$. But thanks to the strong $L^{2}(\Omega)$-convergence pointwise in time, cf. 76g, and with the aid of the control 75 on the Yosida-regularization we deduce

$$
\begin{aligned}
0 & <\alpha=\int_{E}\left(z\left(t_{2}\right)-z\left(t_{1}\right)\right)_{+} \mathrm{d} x=\lim _{\tau \rightarrow 0} \int_{E}\left(\bar{z}_{\tau}\left(t_{2}\right)-\bar{z}_{\tau}\left(t_{1}\right)\right)_{+} \mathrm{d} x \\
& \leq \lim _{\tau \rightarrow 0}\left\|\left(\bar{z}_{\tau}\left(t_{2}\right)-\bar{z}_{\tau}\left(t_{1}\right)\right)_{+}\right\|_{L^{1}(\Omega)} \leq \lim _{\tau \rightarrow 0} \sum_{k=1}^{N_{\tau}}\left\|\left(z_{\tau}^{k}-z_{\tau}^{k-1}\right)_{+}\right\|_{L^{1}(\Omega)} \\
& \leq \lim _{\tau \rightarrow 0} \mathcal{L}^{d+1}([0, \mathrm{~T}] \times \Omega) \sqrt{\frac{2 C \tau}{\mathrm{~T}}}=0,
\end{aligned}
$$

which states a contradiction. Hence the assertion is proven.
5.2.2 Proof of the weak momentum balance 10 c for all $t \in[0, \mathrm{~T}]$ and regularity 77 of the limit function $u$

Let

$$
\begin{equation*}
\tilde{v} \in L^{2}(0, \mathrm{~T} ; \mathbf{U}) \cap H^{1}\left(0, T ; L^{2}\left(\Omega, \mathbb{R}^{d}\right)\right) \tag{98}
\end{equation*}
$$

be a test function for the weak momentum equation in 10 c . We define

$$
\begin{equation*}
v_{\tau}^{k}:=\frac{1}{\tau} \int_{t_{\tau}^{k-1}}^{t_{\tau}^{k}} v(r) \mathrm{d} r \tag{99}
\end{equation*}
$$

and set the interpolants $\bar{v}_{\tau}$ and $v_{\tau}$ as in (43). With this definition there holds

$$
\begin{equation*}
\bar{v}_{\tau} \rightarrow v \text { strongly in } L^{2}(0, \mathrm{~T} ; \mathbf{U}) \tag{100}
\end{equation*}
$$

and

$$
\begin{equation*}
v_{\tau} \rightarrow v \text { strongly in } H^{1}\left(0, \mathrm{~T} ; L^{2}\left(\Omega, \mathbb{R}^{d}\right)\right) . \tag{101}
\end{equation*}
$$

The latter implies $v_{\tau}(t) \rightarrow v(t)$ strongly in $L^{2}\left(\Omega, \mathbb{R}^{d}\right)$ everywhere in $[0, \mathrm{~T}]$. Since 98 implies that $v \in C\left([0, \mathrm{~T}], L^{2}(\Omega)\right)$ we conclude that also

$$
\begin{equation*}
\bar{v}_{\tau}(t) \rightarrow v(t) \text { strongly in } L^{2}\left(\Omega, \mathbb{R}^{d}\right) . \tag{102}
\end{equation*}
$$

Limit passage in the weak balance of momentum: In the time-discrete balance of momentum 38b the acceleration term is now rewritten using the discrete integration-by-parts formula 46

$$
\tau \sum_{k=1}^{L} \int_{\Omega} \frac{\dot{u}_{\tau}^{k}-\dot{u}_{\tau}^{k-1}}{\tau} \cdot v_{\tau}^{k} \mathrm{~d} x=\int_{\Omega}\left(\dot{u}_{\tau}^{L} \cdot v_{\tau}^{L}-\dot{u}_{\tau}^{0} \cdot v_{\tau}^{0}\right) \mathrm{d} x-\tau \sum_{k=1}^{L} \int_{\Omega} \dot{u}_{\tau}^{k-1} \cdot \frac{v_{\tau}^{k}-v_{\tau}^{k-1}}{\tau} \mathrm{~d} x
$$

to obtain

$$
\begin{align*}
& \rho \int_{\Omega} \dot{u}_{\tau}(t) \cdot \bar{v}_{\tau}(t)-\dot{u}_{\tau}(0) \cdot v_{\tau}(0) \mathrm{d} x-\rho \int_{0}^{\bar{t}_{\tau}(t)} \int_{\Omega} \dot{u}_{\tau}(r-\tau) \dot{v}_{\tau}(r) \mathrm{d} x \mathrm{~d} r \\
& +\int_{0}^{\bar{t}_{\tau}(t)} \int_{\Omega}\left[\mathbb{D}\left(\bar{z}_{\tau}\right) e\left(\dot{u}_{\tau}\right)+\mathbb{C}\left(\bar{z}_{\tau}\right) e\left(\bar{u}_{\tau}\right)\right]: e\left(\bar{v}_{\tau}\right) \mathrm{d} x \mathrm{~d} r=\int_{0}^{\bar{t}_{\tau}(t)}\left\langle\bar{f}_{\tau}, \bar{v}_{\tau}\right\rangle_{\mathbf{U}^{*}, \mathbf{U}} \mathrm{~d} r . \tag{103}
\end{align*}
$$

Then, passing to the limit we conclude by weak-strong convergence arguments with the aid of convergences 76 a and (100) that

$$
\begin{equation*}
\rho \int_{\Omega} \dot{u}_{\tau}(t) \cdot \bar{v}_{\tau}(t)-\dot{u}_{\tau}(0) \cdot v_{\tau}(0) \mathrm{d} x \rightarrow \rho \int_{\Omega} \dot{u}(t) \cdot v(t)-\dot{u}(0) \cdot v(0) \mathrm{d} x \text { for all } t \in[0, \mathrm{~T}] \tag{104}
\end{equation*}
$$

Moreover, convergences 76b and 101 lead to

$$
\begin{equation*}
\rho \int_{0}^{\bar{t}_{\tau}(t)} \int_{\Omega} \dot{u}_{\tau}(r-\tau) \cdot \dot{v}_{\tau}(r) \mathrm{d} x \mathrm{~d} r \rightarrow \rho \int_{0}^{t} \int_{\Omega} \dot{u}(r) \cdot \dot{v}(r) \mathrm{d} x \mathrm{~d} r, \tag{105}
\end{equation*}
$$

where the convergence of the translated functions $\dot{u}_{\tau}$ follows by an $\frac{\varepsilon}{3}$-argument using the density of smooth and compactly supported functions in $L^{2}(0, \mathrm{~T} ; \mathbf{U})$. In addition, by (96a) we also have $\bar{f}_{\tau} \rightarrow f$ in $L^{p}\left(0, \mathrm{~T} ; \mathbf{U}^{*}\right)$ for $1 \leq p<\infty$, and thus

$$
\int_{0}^{\bar{t}_{\tau}(t)}\left\langle\bar{f}_{\tau}(r), \bar{v}_{\tau}(r)\right\rangle_{\mathbf{U}^{*}, \mathbf{U}} \mathrm{~d} r \rightarrow \int_{0}^{t}\langle f(r), v(r)\rangle_{\mathbf{U}^{*}, \mathbf{U}} \mathrm{~d} r
$$

follows as well. For the convergence of the quadratic terms, we first realize that convergence 76 g implies by the dominated convergence theorem that

$$
\bar{z}_{\tau} \rightarrow z \text { strongly in } L^{2}\left(0, \mathrm{~T} ; L^{2}(\Omega)\right) .
$$

From this together with 100, and with the isometric isomorphism

$$
L^{2}\left(0, \mathrm{~T} ; L^{2}\left(\Omega, \mathbb{R}^{m}\right)\right) \cong\left\{\tilde{u}:[0, T] \times \Omega \rightarrow \mathbb{R}^{m}, \int_{0}^{\mathrm{T}}\left(\int_{\Omega}|\tilde{u}(t, x)|^{2} \mathrm{~d} x\right) \mathrm{d} t<\infty\right\}
$$

where $m=d^{2}+1$ it follows that, up to a subsequence,

$$
\left(\bar{z}_{\tau}(t, x), e\left(\bar{v}_{\tau}(t, x)\right)\right) \rightarrow(z(t, x), e(v(t, x)))
$$

pointwise for almost all $(t, x) \in[0, \mathrm{~T}] \times \Omega$. Then, by continuity of $|\cdot|, \mathbb{D}$ and $\mathbb{C}$, cf. 14a, we obtain for a.a. $t \in[0, \mathrm{~T}]$

$$
\left|\left[\mathbb{D}\left(\bar{z}_{\tau}(t)\right)+\mathbb{C}\left(\bar{z}_{\tau}(t)\right)\right] e\left(\bar{v}_{\tau}(t)\right)\right| \rightarrow|[\mathbb{D}(z(t))+\mathbb{C}(z(t))] e(v(t))|
$$

pointwise almost everywhere in $\Omega$. In view of 15a and 15b a summable $L^{2}$-majorant is given by $\left(c_{\mathbb{D}}^{*}+c_{\mathbb{D}}^{*}\right)\left|e\left(\bar{v}_{\tau}(t)\right)\right|$ and we conclude by a version of the dominated convergence theorem with $\tau$-dependent majorants, cf. [RF17] Sec. 4.4, Thm. 19, p. 89], that

$$
\left[\mathbb{D}\left(\bar{z}_{\tau}(t)\right)+\mathbb{C}\left(\bar{z}_{\tau}(t)\right)\right] e\left(\bar{v}_{\tau}(t)\right) \rightarrow[\mathbb{D}(z(t))+\mathbb{C}(z(t))] e(v(t))
$$

strongly in $L^{2}\left((0, \mathrm{~T}) \times \Omega ; \mathbb{R}^{d \times d}\right)$. In view of (76a) and 76b), which imply that $e\left(\bar{u}_{\tau}\right) \rightharpoonup e(u)$ as well as $e\left(\dot{u}_{\tau}\right) \rightharpoonup e(\dot{u})$ weakly in $L^{2}\left(0, \mathrm{~T} ; L^{2}\left(\Omega, \mathbb{R}^{d \times d}\right)\right)$, it can be concluded by symmetry of $\mathbb{D}$ and $\mathbb{C}$, and again by weak-strong convergence arguments, that

$$
\int_{0}^{\bar{t}_{\tau}} \int_{\Omega}\left[\mathbb{D}\left(\bar{z}_{\tau}\right) e\left(\dot{u}_{\tau}\right)+\mathbb{C}\left(\bar{z}_{\tau}\right) e\left(\bar{u}_{\tau}\right)\right]: e\left(\bar{v}_{\tau}\right) \mathrm{d} x \mathrm{~d} t \rightarrow \int_{0}^{t} \int_{\Omega}[\mathbb{D}(z) e(\dot{u})+\mathbb{C}(z) e(u)]: e(v) \mathrm{d} x \mathrm{~d} t .
$$

Altogether we conclude that 10 c is satisfied for all $t \in[0, \mathrm{~T}]$.
Regularity [77] of the limit function $u$ : So far, convergences (76a)-76c provide

$$
u \in H^{1}(0, \mathrm{~T} ; \mathbf{U}) \cap L^{\infty}(0, \mathrm{~T} ; \mathbf{U}) \cap W^{1, \infty}\left(0, \mathrm{~T} ; L^{2}(\Omega)\right) .
$$

In view of [Bre73] Appendix, p. 140] this implies that $u:[0, \mathrm{~T}] \rightarrow \mathbf{U}$ is absolutely continuous and hence we also have

$$
u \in C^{0}([0, \mathrm{~T}] ; \mathbf{U})
$$

This provides regularity statement (77a). We now turn to regularity statement 77b) for ü: From the a priori bound (48d) we infer the existence of a subsequence $\left(\dot{u}_{\tau}\right)_{\tau}$ and of an element $\xi \in L^{2}\left(0, \mathrm{~T} ; \mathbf{U}^{*}\right)$ such that $\mathrm{D}_{\tau} \dot{u}_{\tau} \rightharpoonup \xi$ in $L^{2}\left(0, \mathrm{~T} ; \mathbf{U}^{*}\right)$. In view of the strong convergences 101 \& 102 of the approximating test functions, the discrete integration-by-parts formula 46 and of the already deduced limits 104, and 105, we see that

$$
\begin{align*}
& \int_{0}^{\bar{t}_{\tau}}\left\langle\rho \mathrm{D}_{\tau} \dot{u}_{\tau}(r), \bar{v}_{\tau}(r)\right\rangle_{\mathbf{U}^{*}, \mathbf{U}} \mathrm{~d} r \\
& =\rho \int_{\Omega}\left(\dot{u}_{\tau}(t) \cdot \bar{v}_{\tau}(t)-\dot{u}_{\tau}(0) \cdot v_{\tau}(0)\right) \mathrm{d} x-\rho \int_{0}^{\bar{t}_{\tau}(t)} \int_{\Omega} \dot{u}_{\tau}(r-\tau) \dot{v}_{\tau}(r) \mathrm{d} x \mathrm{~d} r \\
& \quad \downarrow  \tag{106}\\
& \int_{0}^{t}\langle\rho \xi(r), v(r)\rangle_{\mathbf{U}^{*}, \mathbf{U}} \mathrm{~d} r \\
& =\rho \int_{\Omega}(\dot{u}(t) \cdot v(t)-\dot{u}(0) \cdot v(0)) \mathrm{d} x-\rho \int_{0}^{t} \int_{\Omega} \dot{u}(r) \cdot \dot{v}(r) \mathrm{d} x \mathrm{~d} r
\end{align*}
$$

for all test functions $v \in H^{1}\left(0, \mathrm{~T} ; L^{2}(\Omega)\right) \cap L^{2}(0, \mathrm{~T} ; \mathbf{U})$. This shows that

$$
\xi=\ddot{u} \in L^{2}\left(0, \mathbf{T} ; \mathbf{U}^{*}\right),
$$

and 106 states an integration by parts formula for the limit function $u$. Moreover, since the spaces $\mathbf{U} \subset L^{2}\left(\Omega ; \mathbb{R}^{d}\right) \subset$ $\mathbf{U}^{*}$ form an evolution triple, in view of e.g. [Rou06 Lemma 7.3, p. 191] we also have an integration-by-parts formula for $\dot{u}$

$$
\begin{aligned}
\int_{s}^{t}\langle\ddot{u}(r), \dot{u}(r)\rangle_{\mathbf{U}^{*}, \mathbf{U}} & =\frac{1}{2}\langle\dot{u}(t), \dot{u}(t)\rangle_{\mathbf{U}^{*}, \mathbf{U}}-\frac{1}{2}\langle\dot{u}(s), \dot{u}(s)\rangle_{\mathbf{U}^{*}, \mathbf{U}} \\
& =\frac{1}{2}\|\dot{u}(t)\|_{L^{2}\left(\Omega ; \mathbb{R}^{d}\right)}^{2}-\frac{1}{2}\|\dot{u}(s)\|_{L^{2}\left(\Omega ; \mathbb{R}^{d}\right)}^{2} .
\end{aligned}
$$

This concludes the proof of statements 77.

### 5.2.3 Rate-independent evolution of the phase-field variable 10a \& 11

We first show that the limit pair $(u, z)$ satisfies the one-sided variational inequality 10a for a.a. $t \in(0, \mathrm{~T})$, which provides a rate-independent evolution law for $z$. From this, we will deduce by convexity arguments that also semistability inequality (11) is valid.

Proof of the one-sided variational inequality 10a. We test the time-discrete evolution equation 47a, with functions $\eta \in \mathbf{Y}$ with the property $\eta \leq 0$ a.e. in $\Omega$. Then, omitting the negative term $\int_{\Omega} N_{\tau}\left(\dot{z}_{\tau}(t)\right)_{+} \eta \mathrm{d} x$, one obtains after rearranging

$$
\begin{align*}
& \int_{\Omega}\left[-\frac{1}{\ell}\left(1-\bar{z}_{\tau}(t)\right)+M \dot{z}_{\tau}(t)\right] \eta+\ell \nabla \bar{z}_{\tau}(t) \cdot \nabla \eta \mathrm{d} x \\
& \quad \geq \int_{\Omega}\left[\frac{1}{2} \mathbb{C}^{\prime}\left(\bar{z}_{\tau}(t)\right) e\left(\underline{u}_{\tau}(t)\right): e\left(\underline{u}_{\tau}(t)\right)\right](-\eta) \mathrm{d} x \geq 0 . \tag{107}
\end{align*}
$$

To pass to the limit in this inequality we want to make use of lower semicontinuity arguments on the right-hand side and upper semicontinuity on the left-hand side. For this we note that the term $\int_{\Omega} M \dot{z}_{\tau}(t) \eta \mathrm{d} x$ cannot be handled pointwise in time. Hence, in the following we consider an arbitrary measureable set $I \subset[0, T]$. We integrate 107 over $I$

$$
\begin{align*}
& \int_{I} \int_{\Omega}\left[-\frac{1}{\ell}\left(1-\bar{z}_{\tau}(t)\right)+M \dot{z}_{\tau}(t)\right] \eta+\ell \nabla \bar{z}_{\tau}(t) \cdot \nabla \eta \mathrm{d} x \mathrm{~d} t \\
& \quad \geq \int_{I} \int_{\Omega}\left[\frac{1}{2} \mathbb{C}^{\prime}\left(\bar{z}_{\tau}(t)\right) e\left(\underline{u}_{\tau}(t)\right): e\left(\underline{u}_{\tau}(t)\right)\right](-\eta) \mathrm{d} x \mathrm{~d} t \tag{108}
\end{align*}
$$

and aim to pass to the limit in using lower and upper semicontinuity arguments.
We first discuss the limit passage on the left-hand side by upper semicontinuity. In fact, the limes superior of the left-hand side of 108 is further estimated by

$$
\begin{align*}
& \limsup _{\tau \rightarrow 0} \int_{I} \int_{\Omega}\left[-\frac{1}{\ell}\left(1-\bar{z}_{\tau}(t)\right)+M \dot{z}_{\tau}(t)\right] \eta+\ell \nabla \bar{z}_{\tau}(t) \cdot \nabla \eta \mathrm{d} x \mathrm{~d} t \\
& \leq \limsup _{\tau \rightarrow 0} \int_{I} \int_{\Omega} M \dot{z}_{\tau}(t) \eta \mathrm{d} x \mathrm{~d} t+\limsup _{\tau \rightarrow 0} \int_{I} \int_{\Omega}\left[-\frac{1}{\ell}\left(1-\bar{z}_{\tau}(t)\right) \eta+\ell \nabla \bar{z}_{\tau}(t) \cdot \nabla \eta\right] \mathrm{d} x \mathrm{~d} t \tag{109}
\end{align*}
$$

For the first term on the right-hand side of 109) we exploit the bound 48f that provides

$$
\sqrt{M}\left\|\dot{z}_{\tau}\right\|_{L^{2}\left(0, T ; L^{2}(\Omega)\right)} \leq C
$$

and also use that $M(\tau) \rightarrow 0$ as $\tau \rightarrow 0$. In this way we obtain

$$
\begin{align*}
\limsup _{\tau \downarrow 0}\left|\int_{I} \int_{\Omega} M \dot{z}_{\tau}(t) \eta \mathrm{d} x \mathrm{~d} t\right| & \leq \underset{\tau \downarrow 0}{\limsup } M\left\|\dot{z}_{\tau}\right\|_{L^{2}\left(I, L^{2}(\Omega)\right)}\|\eta\|_{L^{2}(\Omega)} \mathcal{L}^{1}(I)^{\frac{1}{2}}  \tag{110}\\
& \leq \underset{\tau \downarrow 0}{\limsup } \sqrt{M} C\|\eta\|_{L^{2}(\Omega)} \mathcal{L}^{1}(I)^{\frac{1}{2}}=0
\end{align*}
$$

For the second term on the right-hand side of 109 we find with convergence (76h

$$
\begin{align*}
& \lim _{\tau \downarrow 0} \int_{I} \int_{\Omega}\left[-\frac{1}{\ell}\left(1-\bar{z}_{\tau}(t)\right)\right] \eta+\ell \nabla \bar{z}_{\tau}(t) \cdot \nabla \eta \mathrm{d} x \mathrm{~d} t  \tag{111}\\
& \quad=\int_{I} \int_{\Omega}\left[-\frac{1}{\ell}(1-z(t))\right] \eta+\ell \nabla z(t) \cdot \nabla \eta \mathrm{d} x \mathrm{~d} t
\end{align*}
$$

Thus 110 and 111 provide an estimate for the limit superior of the left-hand side of 108 .
We now aim to pass to the limit on the right-hand side of 108 by weak lower semicontinuity. For this we observe that property 14 b for the degradation function implies that $\mathbb{C}^{\prime}(z)$ is positive definite. Hence, $-\eta \mathbb{C}^{\prime}(z)$ is positive semidefinite thanks to $-\eta \geq 0$ a.e. in $\Omega$. Invoking the lower semicontinuity result [Dac12, Thm. 3.4, p. 74] we conclude that the
functional $(z, \xi) \mapsto \int_{\Omega}(-\eta) \mathbb{C}^{\prime}(z) e(\xi): e(\xi) \mathrm{d} x$ is lower semi-continuous with respect to convergences 76d and 76 g . Hence,

$$
\begin{aligned}
& \liminf _{\tau \downarrow 0} \int_{\Omega}\left[\frac{1}{2} \mathbb{C}^{\prime}\left(\bar{z}_{\tau}(t)\right) e\left(\underline{u}_{\tau}(t)\right): e\left(\underline{u}_{\tau}(t)\right)\right](-\eta) \mathrm{d} x \\
& \quad \geq \int_{\Omega}\left[\frac{1}{2} \mathbb{C}^{\prime}(z(t)) e(u(t)): e(u(t))\right](-\eta) \mathrm{d} x \geq 0
\end{aligned}
$$

for all $t \in[0, \mathrm{~T}]$. Then Fatou's lemma yields

$$
\begin{gather*}
\liminf _{\tau \downarrow 0} \int_{I} \int_{\Omega}\left[\frac{1}{2} \mathbb{C}^{\prime}\left(\bar{z}_{\tau}(t)\right) e\left(\underline{u}_{\tau}(t)\right): e\left(\underline{u}_{\tau}(t)\right)\right](-\eta) \mathrm{d} x \mathrm{~d} t \\
\geq \int_{I} \int_{\Omega}\left[\frac{1}{2} \mathbb{C}^{\prime}(z(t)) e(u(t)): e(u(t))\right](-\eta) \mathrm{d} x \mathrm{~d} t \tag{112}
\end{gather*}
$$

Putting together 108-112 it follows for the limit that

$$
\int_{I} \int_{\Omega}\left[\frac{1}{2} \mathbb{C}^{\prime}(z(t)) e(u(t)): e(u(t))-\frac{1}{\ell}(1-z(t))\right] \eta+\ell \nabla z(t) \cdot \nabla \eta d x \mathrm{~d} t \geq 0
$$

holds for every measurable set $I \subset[0, \mathrm{~T}]$. This implies that

$$
\begin{equation*}
\int_{\Omega}\left(\left[\frac{1}{2} \mathbb{C}^{\prime}(z(t)) e(u(t)): e(u(t))-\frac{1}{\ell}(1-z(t))\right] \eta+\ell \nabla z(t) \cdot \nabla \eta\right) \mathrm{d} x \geq 0 \tag{113}
\end{equation*}
$$

for almost every $t \in(0, \mathrm{~T})$ and for all test functions $\eta \in \mathbf{Y}$ with $\eta \leq 0$ a.e. in $\Omega$, that is 10a.
Proof of the semistability inequality (11). The one-sided variational inequality 10a is now used to show semistability 11. Thanks to 97 we have $0 \leq z(t) \leq 1$ a.e. in $\Omega$ for all $t \in[0, \mathrm{~T}]$. By assumptions 14d the interval $[0,1]$ is contained in the convexity regime of the degradation function, so that the functional $\mathcal{E}(t, \cdot, u(t))$ is convex. Hence, for any test function $\tilde{z}$ with $0 \leq \tilde{z} \leq z(t)$ a.e. in $\Omega$ it follows from 10a by convexity

$$
\begin{equation*}
0 \geq\left\langle-\mathrm{D}_{z} \mathcal{E}(t, u(t), z(t)), \tilde{z}-z(t)\right\rangle_{\mathbf{x}^{*}, \mathbf{x}} \geq \mathcal{E}(t, u(t), z(t))-\mathcal{E}(t, u(t), \tilde{z}) \tag{114}
\end{equation*}
$$

for a.e. $t \in(0, \mathrm{~T})$. In view of the definition of $\mathcal{R}$ in (5) this implies

$$
\begin{equation*}
\mathcal{E}(t, u(t), z(t)) \leq \mathcal{E}(t, u(t), \tilde{z})+\mathcal{R}(\tilde{z}-z(t)) \tag{115}
\end{equation*}
$$

for all $\tilde{z} \in \mathbf{X}$ with $0 \leq \tilde{z} \leq 1$ a.e. in $\Omega$ for a.e. $t \in(0, \mathrm{~T})$.
5.2.4 Proof of the energy-dissipation balance 10d for a.e. $t \in(0, T)$.

We first pass to the limit in the time-discrete upper energy dissipation estimate (47d] by exploiting weak lower semicontinuity arguments on its left-hand side and the well-preparedness of the given data on its right-hand side. Secondly, the energy-dissipation balance (10d] will be concluded by exploiting the already deduced weak momentum balance (10c) and semistability [11] for the limit pair $(u, z)$ in a Riemann-sum argument as commonly used for rate-independent systems, of. e.g., [DMFT05, MR06, MR15]. Note that our proofs provide the weak momentum balance to hold for all $t \in[0, \mathrm{~T}]$, cf. Sec. 5.2 .2 whereas the semistability inequality so far has been deduced in Sec. 5.2 .3 to hold for a.e. $t \in(0, \mathrm{~T})$, only. This is why we here as a first step find the energy-dissipation balance (10d to be valid for a.e. $t \in(0, \mathrm{~T})$, only. Yet, this gives the basis to apply the regularity result stated in Theorem[5.2 to obtain the temporal continuity of $z$ and thus to conclude that 10d holds true for all $t \in[0, \mathrm{~T}]$; we refer to the subsequent Sec. 5.3 for this proof.

Proof of an upper energy-dissipation estimate for all $t \in[0, \mathrm{~T}]$ : We pass to the limit in 47d by adapting the arguments of [LRTT18] Lemma 4.4]. We first discuss the limit passage on the left-hand side of 47d] exploiting the weak lower semicontinuity and positivity of the functionals involved. In difference to [LRTT18] in 47d] there also appears the viscous contribution of the damage evolution. For all $\tau>0$ this term is non-negative, so that we estimate it from below by
$\int_{0}^{t} 2 \mathcal{R}_{M \tau}\left(\dot{z}_{\tau}(r)\right) \mathrm{d} r \geq 0$. For the viscous dissipation of the displacements we argue by weak lower semicontinuity. For this, we realize that the map $(z, \xi) \mapsto \mathbb{D}(z) e(\xi): e(\xi)$ is continuous and that the map $\xi \mapsto \mathbb{D}(z) e(\xi): e(\xi)$ is convex for all $(z, \xi) \in \mathbb{R} \times \mathbb{R}^{d \times d}$ by the assumptions on regularity and positive definiteness of $\mathbb{D}$ in 13 and 14. Thus, [Dac12 Theorem 3.4, p. 74] provides the lower semicontinuity of the functional $\mathcal{V}$ with respect to the topologies given by 76 e and 76g), so that we find $\liminf _{\tau \rightarrow 0} \mathcal{V}\left(\bar{z}_{\tau}(r) ; \dot{u}_{\tau}(r)\right) \geq \mathcal{V}(z(r) ; \dot{u}(r)) \geq 0$ for all $r \in[0, \mathrm{~T}]$, also thanks to the positive definiteness of $\mathbb{D}$. This justifies the application of Fatou's lemma, so that we conclude

$$
\begin{aligned}
\liminf _{\tau \rightarrow 0} \int_{0}^{\bar{t}_{\tau}(t)} 2 \mathcal{V}\left(\bar{z}_{\tau}(r) ; \dot{u}_{\tau}(r)\right) \mathrm{d} r & \geq \int_{0}^{t} \liminf _{\tau \rightarrow 0} 2 \mathcal{V}\left(\bar{z}_{\tau}(r) ; \dot{u}_{\tau}(r)\right) \mathrm{d} r \\
& \geq \int_{0}^{t} 2 \mathcal{V}(z(r) ; u(r)) \mathrm{d} r
\end{aligned}
$$

where we also used that $\bar{\tau}_{\tau}(t) \geq t$ for all $t \in[0, \mathrm{~T}]$ by construction (44.
For the kinetic energy we also have $\lim _{\inf _{\tau \rightarrow 0}} \mathcal{K}\left(u_{\tau}(t)\right) \geq \mathcal{K}(u(t))$ for all $t \in[0, \mathrm{~T}]$ by the weak convergence 776 e and thanks to the weak lower semicontinuity of the $L^{2}\left(\Omega, \mathbb{R}^{\bar{d}}\right)$-norm.
We now comment on the weak lower semi-continuity of $\overline{\mathcal{E}}_{\tau}$ : With the same arguments as for $\mathcal{V}$, making use of DDac12] Theorem 3.4, p.74], we deduce that the stored elastic energy $(z, u) \mapsto \int_{\Omega} \frac{1}{2} \mathbb{C}(z) e(u): e(u) \mathrm{d} x$ is lower semicontinuous with respect to the topologies given by 76 d$)$ and 76 g$)$ and also that the phase-field energy $(z, \xi) \mapsto \int_{\Omega} \frac{\ell}{2}|\xi|^{2}+\frac{1}{2 \ell}(1-$ $z)^{2} \mathrm{~d} x$ is lower semicontinuous with respect to the topologies (76f) and 76 g . Additionally, the convergence of the external loading term follows from the strong convergence (96c together with the weak convergence 76d. In this way, we pass to the limit on the left-hand side of 47d.
As for the right-hand side of (47d), we realize that $\mathcal{K}\left(u_{\tau}\right)+\overline{\mathcal{E}}_{\tau}\left(0, \bar{u}_{\tau}(0), \bar{z}_{\tau}(0)\right)=\mathcal{K}\left(\dot{u}_{0}\right)+\overline{\mathcal{E}}_{\tau}\left(0, u_{0}, z_{0}\right)$ is constant for all $\tau>0$. In the power of the external loadings we pass to the limit using that $\bar{t}_{\tau}(t) \geq t$ for all $t \in[0, \mathrm{~T}]$ and also with the strong $H^{1}\left(0, \mathrm{~T} ; \mathbf{U}^{*}\right)$-convergence 96 d of $\left(f_{\tau}\right)_{\tau}$ guaranteed by the regularity assumption [17, and the weak $L^{\infty}(0, \mathrm{~T} ; \mathbf{U})$-convergence of $\left(\underline{u}_{\tau}\right)_{\tau}$. In this way we conclude the upper energy dissipation estimate for the limit system $\left(\mathbf{U}, \mathbf{W}, \mathbf{Z}, \mathcal{V}, \mathcal{K}, \mathcal{R}_{1}, \mathcal{E}\right)$

$$
\begin{align*}
& \mathcal{K}(\dot{u}(t))+\mathcal{E}(t, u(t), s(t))+\int_{0}^{t} 2 \mathcal{V}(z(r) ; \dot{u}(r)) \mathrm{d} r \\
& \leq \mathcal{K}\left(\dot{u}_{0}\right)+\mathcal{E}\left(0, u_{0}, z_{0}\right)+\int_{0}^{t} \partial_{t} \mathcal{E}(r, u(r), z(r)) \mathrm{d} r \tag{116}
\end{align*}
$$

for all $t \in[0, \mathrm{~T}]$.
Proof of the energy-dissipation balance (10d for a.e. $t \in(0, T)$. We now discuss that 116 even holds as an equality for a.e. $t \in(0, \mathrm{~T})$. For this, we follow standard arguments for rate-independent systems, cf. e.g. [DMFT05, MR06, MR15] and also [RT17a] for abstract results on coupled rate-independent/rate-dependent systems, which deduce a lower energydissipation estimate opposite to 116 by exploiting a Riemann-sum argument using the momentum balance 10c and the semistability inequality [11] of the limit system. We only point out here the main ingredients and refer to [LRTT18, Sec. 4.3] for the details of the calculation.

So far, semistability inequality [11] is valid a.e. in $(0, T)$, only. Hence, let $t \in(0, T)$ be such that 11 holds true. Moreover, it is possible to choose a sequence of partitions $\left(\Pi_{\theta}\right)_{\theta}$ with $\Pi_{\theta}=\left\{0=t_{\theta}^{0}<t_{\theta}^{1}<\ldots<t_{\theta}^{N_{\theta}}=t\right\}$ of the interval $[0, t]$ such that [11] also holds true for the collection of nodes and such that also

$$
\begin{gather*}
\lim _{\theta \downarrow 0} \sum_{k=1}^{N_{\theta}} \int_{t_{\theta}^{k-1}}^{t_{\theta}^{k}} \int_{\Omega} \mathbb{C}\left(z\left(t_{\theta}^{k}\right)\right) e(u(r)): e(\dot{u}(r)) \mathrm{d} x \mathrm{~d} r  \tag{117}\\
\quad=\int_{0}^{t} \int_{\Omega} \mathbb{C}(z(r)) e(u(r)): e(\dot{u}(r)) \mathrm{d} x \mathrm{~d} r
\end{gather*}
$$

for this, see also Remark 6.3. Semistability inequality [11 for the limit pair $(u, z)$ at time $t_{\theta}^{k-1}$ is now tested with $z_{\theta}^{k}$, which is a bounded test function by (41) and ensures that $\mathcal{R}\left(z_{\theta}^{k}-z_{\theta}^{k-1}\right)=0$ by unidirectionality property 10 b . Summing up
over $k \in\left\{1, \ldots, N_{\theta}\right\}$ and taking the limit as $\theta \downarrow 0$ results in

$$
\begin{align*}
\mathcal{E}(0, u(0), s(0)) \leq & \mathcal{E}(t, u(t), z(t))-\int_{0}^{t} \int_{\Omega} \mathbb{C}(z(r)) e(u(r)): e(\dot{u}(r)) \mathrm{d} x \mathrm{~d} r \\
& +\int_{0}^{t}\langle f(r), \dot{u}(r)\rangle_{\mathbf{U}^{*}, \mathbf{U}} \mathrm{~d} r-\int_{0}^{t} \partial_{t} \mathcal{E}(r, u(r), s(r)) \mathrm{d} r . \tag{118}
\end{align*}
$$

where one also uses 117) and that $-\langle\dot{f}(r), u(r)\rangle_{\mathbf{U}^{*}, \mathbf{U}}=\partial_{t} \mathcal{E}(r, u(r), s(r))$.
Secondly, the weak momentum balance 10c] at time the tested by $\dot{u}$. This is admissible thanks to the regularity statements 77) already deduced in Sec.5.2.2 Applying the integration-by-parts formula (77C) to the kinetic term then results in

$$
\begin{align*}
& \frac{\rho}{2}\|\dot{u}(t)\|_{L^{2}\left(\Omega, \mathbb{R}^{d}\right)}^{2}+\int_{0}^{t} \int_{\Omega}[\mathbb{D}(s) e(\dot{u})+\mathbb{C}(s) e(u)]: e(\dot{u}) \mathrm{d} x \mathrm{~d} r  \tag{119}\\
& =\frac{\rho}{2}\|\dot{u}(0)\|_{L^{2}\left(\Omega, \mathbb{R}^{d}\right)}^{2}+\int_{0}^{t}\langle f(r), \dot{u}(r)\rangle_{\mathbf{U}^{*}, \mathbf{U}} \mathrm{~d} r
\end{align*}
$$

Summing up 118 and 119 ultimately yields

$$
\begin{aligned}
\mathcal{E}(0, u(0), z(0)) \leq & \mathcal{E}(t), u(t), z(t))+\frac{\rho}{2}\|\dot{u}(t)\|_{L^{2}\left(\Omega, \mathbb{R}^{d}\right)}^{2}-\frac{\rho}{2}\|\dot{u}(0)\|_{L^{2}\left(\Omega, \mathbb{R}^{d}\right)}^{2} \\
& +\int_{0}^{t} \int_{\Omega} \mathbb{D}(z(r)) e(\dot{u}(r)): e(\dot{u}(r)) \mathrm{d} x \mathrm{~d} r-\int_{0}^{t} \partial_{r} \mathcal{E}(r, u(r), s(r)) \mathrm{d} r,
\end{aligned}
$$

which is the estimate opposite to 116. In this way, the energy-dissipation balance 10d is deduced to hold for a.e. $t \in(0, \mathrm{~T})$.

### 5.3 Proof of the temporal Hölder-continuity $z \in C^{0,1 / 4}([0, \mathrm{~T}) ; \mathbf{X})$ and validity of properties (10a), (11) \& 10d) for all $t \in[0, \mathrm{~T})$

To deduce that the limit $z$ has the temporal Hölder-regularity 78 assumptions A1)-A8) of Theorem 5.2 have to be checked. To this end, we collect the corresponding properties of $\mathcal{E}$ from (8) and $\mathcal{V}$ from (6) in the following

Lemma 5.4. Let $\mathcal{E}$ and $\mathcal{V}$ be given as in 8 and 6 such that assumptions [12- 18 hold true. The following statements are valid for the energy functional $\mathcal{E}$ :

1 Let $\mathrm{D}_{c}:=\left\{\tilde{z} \in \mathbf{X}, 0 \leq \tilde{z} \leq z_{*}\right.$ a.e. in $\left.\Omega\right\}$ denote the convexity regime of $\mathcal{E}(t, u, \cdot)$ in accordance with (14). Then for all $t \in[0, \mathrm{~T}]$ and $u:[0, \mathrm{~T}] \rightarrow \mathbf{U}$ a solution of 10 c the energy functional $\mathcal{E}(t, u(t), \cdot): \mathrm{D}_{c} \rightarrow \mathbb{R}$ is uniformly convex. More precisely, it satisfies inequality (84) with the constants $\alpha=2, C_{\star}=\min \left\{\frac{\ell}{2}, \frac{1}{2 \ell}\right\}$, and the Banach space $\mathbf{S}=\mathbf{X}$.
2 The functional $\mathcal{E}(t, \cdot, z): \mathbf{U} \rightarrow \mathbb{R}$ satisfies Hölder estimate 85 with $\beta_{u}=1$ and a constant $c_{\star}=c_{\star}(E, f)>0$.
3 The functional $\mathcal{E}(t, \cdot, z): \mathbf{U} \rightarrow \mathbb{R}$ is Gâteaux-differentiable and it satisfies the gradient estimate 86 with the exponent $\sigma=2$.

Moreover, the dissipation potential $\mathcal{V}$ has $p$-growth for $p=2$, i.e.,

$$
\begin{equation*}
\mathcal{V}(z ; v) \geq \frac{c_{\mathbb{D}}^{0}}{2 C_{\mathrm{K}}^{2}}\|v\|_{\mathbf{U}}^{2} \quad \text { for all }(z, v) \in \mathbf{Z} \times \mathbf{U} \tag{120}
\end{equation*}
$$

with Korn's constant $C_{\mathrm{K}}>0$ and $c_{\mathbb{D}}^{0}>0$ from coercivity assumption 15a.
Proof. To Item 1., uniform convexity: Recall that the stored elastic energy functional $z \mapsto \int_{\Omega} \frac{1}{2} \mathbb{C}(z) e(u): e(u) \mathrm{d} x$ is convex for all $z \in \mathrm{D}_{c}$ by assumption [14. Moreover, for the phase-field functional $z \mapsto \int_{\Omega} \frac{\ell}{2}|\nabla z|^{2}+\frac{1}{2 \ell}|z|^{2} \mathrm{~d} x$ we see that the quadratic map $a \mapsto c|a|^{2}$ satisfies for all $a_{1}, a_{2} \in \mathbb{K} \in\left\{\mathbb{R}, \mathbb{R}^{d}\right\}$ and for all $\lambda \in[0,1]$

$$
c\left|\lambda a_{1}+(1-\lambda) a_{2}\right|^{2}=\lambda c\left|a_{1}\right|^{2}+(1-\lambda) c\left|a_{2}\right|^{2}-\lambda(1-\lambda) c\left|a_{1}-a_{2}\right|^{2}
$$

From that we conclude the statement when setting $a_{i}=\nabla z_{i}$ with $c=\frac{\ell}{2}$ and $a_{i}=\left(1-z_{i}\right)$ with $c=\frac{1}{2 \ell}$, for $i=1,2$, and by adding the two results.
To Item 2., Hölder-continuity of $\mathcal{E}$ : Let $\left(u_{i}, z_{1}\right)$ so that $\sup _{t \in[0, \mathrm{~T}]} \mathcal{E}\left(t, u_{i}, z_{1}\right) \leq E$ for $i=0,1$. In view of assumptions (15b) on $\mathbb{C}$ and 17 on $f$ we find for all $t \in[0, \mathrm{~T}]$

$$
\begin{aligned}
& \left|\mathcal{E}\left(t, u_{1}, z_{1}\right)-\mathcal{E}\left(t, u_{0}, z_{1}\right)\right| \\
& \left.\left.\left.\left.=\left\lvert\, \int_{\Omega} \frac{1}{2} \mathbb{C}\left(z_{1}\right)\left(e\left(u_{1}\right)\right)\right.: e\left(u_{1}\right)\right)-e\left(u_{0}\right)\right): e\left(u_{0}\right)\right)\right) \mathrm{d} x-\left\langle f(t), u_{1}-u_{0}\right\rangle_{\mathbf{U}^{*}, \mathbf{U}} \mid \\
& \leq \frac{c_{\mathbb{C}}^{*}}{2}\left(\left\|u_{1}\right\|_{\mathbf{U}}+\left\|u_{0}\right\|_{\mathbf{U}}\right)\left\|u_{1}-u_{0}\right\|_{\mathbf{U}}+\sup _{t \in[0, \mathbf{T}]}\|f(t)\|_{\mathbf{U}^{*}}\left\|u_{1}-u_{0}\right\|_{\mathbf{U}} \leq c_{\star}\left\|u_{1}-u_{0}\right\|_{\mathbf{U}}
\end{aligned}
$$

Here we also checked that $\left\|u_{1}\right\|_{\mathbf{U}}+\left\|u_{0}\right\|_{\mathbf{U}} \leq 2\left(E+\frac{c_{\mathrm{K}}^{2}}{2 c_{\mathrm{C}}^{0}} \sup _{t \in[0, \mathrm{~T}]}\|f(t)\|_{\mathbf{U}^{*}}^{2}\right)^{1 / 2}$ by repeating the calculations for a priori bound 71 .
To Item 3., Gâteaux-differentiability of $\mathcal{E}$ and gradient estimate (86: Gâteaux-differentiability of the functional $u \mapsto$ $\mathcal{E}(t, u, z)=\int_{\Omega} \frac{1}{2} \mathbb{C}(z) e(u): e(u) \mathrm{d} x-\langle f(t), u\rangle_{\mathbf{U}}$ is clear and we now deduce gradient estimate 86]. For this, we calculate

$$
\begin{aligned}
& \left\|\mathrm{D}_{u} \mathcal{E}(t, u, z)\right\|_{\mathbf{U}^{*}}=\sup _{v \in \mathbf{U}}^{\|v\|_{\mathbf{U}=1}}\left\langle\mathrm{D}_{u} \mathcal{E}(t, u, z), v\right\rangle_{\mathbf{U}^{*}, \mathbf{U}} \\
& \leq \sup _{\substack{v \in \mathbf{U} \\
\|v\|_{\mathbf{U}}}}\left(\frac{c_{\mathbb{C}}^{*}}{2}\|e(u)\|_{L^{2}(\Omega)}\|e(v)\|_{L^{2}(\Omega)}+\sup _{t \in[0, \mathbf{T}]}\|f(t)\|_{\mathbf{U}^{*}}\|v\|_{\mathbf{U}}\right) \\
& \leq \frac{c_{\mathbb{C}}^{*}}{2}\left(\frac{4 C_{\mathrm{K}}}{c_{\mathbb{C}}^{0}}\left(\int_{\Omega} \frac{1}{2} \mathbb{C}(z) e(u): e(u) \mathrm{d} x-\langle f(t), u\rangle_{\mathbf{U}}\right)\right)^{1 / 2}+\sup _{t \in[0, \mathrm{~T}]}\|f(t)\|_{\mathbf{U}^{*}} \\
& \leq \max \left\{\frac{c_{\mathbb{C}}^{*}}{2}, \sup _{t \in[0, \mathbf{T}]}\|f(t)\|_{\mathbf{U}^{*}}\right\}\left(\frac{4 C_{\mathrm{K}}}{c_{\mathbb{C}}^{0}}\left(\int_{\Omega} \frac{1}{2} \mathbb{C}(z) e(u): e(u) \mathrm{d} x-\langle f(t), u\rangle_{\mathbf{U}}\right)+1\right)^{1 / 2},
\end{aligned}
$$

which shows that $\left\|\mathrm{D}_{u} \mathcal{E}(t, u, z)\right\|_{\mathbf{U}^{*}}^{2} \leq \tilde{c}(\hat{c} \mathcal{E}(t, u, z)+1)$ and thus establishes 86 with the exponent $\sigma=2$.

Consider now the pair $(u, z):[0, \mathrm{~T}] \rightarrow \mathbf{U} \times \mathbf{Z}$ obtained by convergences 76 . Recall that the results of Sec. 5.2 .3 and 5.2.4 already provide the semistability inequality (11) and the energy-dissipation balance (10d to hold for a.e. $t \in[0, \mathrm{~T}]$, i.e., for all $t \in[0, \mathrm{~T}] \backslash N$ with the $\mathcal{L}^{1}$-null set $N$ as in 81. Balance 10d also directly implies the upper energy-dissipation estimate (82) to be valid for all subintervals $[s, t] \subset[0, \mathrm{~T}]$ with $s, t \in[0, \mathrm{~T}] \backslash N$. Thus, assumptions A1) and A2) of Theorem [5.2 are satisfied. Moreover, regularity assumption A3) for $u$ is clearly ensured by regularity statements [77a] \& 77b. In Section 5.2.2 we already verified that the weak momentum balance 10 c holds true for all $t \in[0, \mathrm{~T}]$, which gives A9). We further note that above Lemma 5.4 also provides the validity of assumptions A5)-A8), and A10) while the power control A4) can be proven using coercivity of the system energy and the uniform bound on $\dot{f}$. Consequently, we are now in the position to conclude the temporal Hölder-continuity $z \in C^{0,1 / 4}([0, \mathrm{~T}) ; \mathbf{X})$ and the validity of properties 10a, 11], and 10 d on all of $[0, \mathrm{~T})$ as a corollary:

Corollary 5.5. Let the assumptions of Lemma 5.4 be satisfied and let the variational inequality 10a hold true for the initial datum $\left(u_{0}, z_{0}\right)$. Then the functionals $\mathcal{E}$ and $\mathcal{V}$ comply with the assumptions A1)-A10) of Theorem 5.2 and thus, for the pair $(u, z)$ obtained by convergences (76], inequalities (90) and (91) are valid for all subintervals $[s, t] \subset[0, \mathrm{~T}]$ with $s, t \in[0, \mathrm{~T}] \backslash N$.

1 For all $\hat{t} \in N \cap(0, \mathrm{~T})$ there are sequences $\left(t_{n}^{ \pm}\right)_{n} \subset[0, \mathrm{~T}] \backslash N$ such that $t_{n}^{-} \nearrow \hat{t}, t_{n}^{+} \searrow \hat{t}$ as $n \rightarrow \infty$ and, $z^{-}=\lim _{n \rightarrow \infty} z\left(t_{n}^{-}\right)=\lim _{n \rightarrow \infty} z\left(t_{n}^{+}\right)=z^{+}$in $\mathbf{X}$ thanks to the validity of inequalities 90 and (91) for $\left[t_{n}^{-}, t_{n}^{+}\right], n \in \mathbb{N}$.
2 Further let $\mathcal{R}$ as in (5) encode a unidirectional evolution of the rate-independent variable. Then $z\left(t_{n}^{+}\right) \leq z(\hat{t}) \leq$ $z\left(t_{n}^{-}\right)$for all $n \in \mathbb{N}$ and like in the proof of the continuity in the viscous case after 160 at first $z^{-}=z(\hat{t})=z^{+}$ in $\mathbf{X}$, and then with a similar argumentation $z \in C^{0}([0, \mathbf{T}) ; \mathbf{X})$.

3 In addition, let $u \in C^{0}([0, \mathrm{~T}], \mathrm{U})$, as guaranteed by 77a. Then, the one-sided variational inequality 10a, semistability inequality [11], and the energy-dissipation balance [10d are valid even for all $t \in[0, \mathrm{~T})$. Consequently, also estimate $\sqrt[91]{ }$ is valid for all $t \in[0, \mathrm{~T})$ and thus ensures the temporal Hölder-continuity $z \in$ $C^{0, h}([0, \mathrm{~T}) ; \mathbf{X})$ with the Hölder-exponent $h=\frac{\beta_{u}}{2 \alpha}=\frac{1}{4}$ for $\beta_{u}=1$ and $\alpha=2$ obtained in Lemma 5.4

We point out that the initial time $t=0$ is a (Hölder-) continuity point of $z$, since the variational inequality 10a and thus semistability [11] are satisfied by assumption. Hence, $0 \in[0, T] \backslash N$ and one obtains the validity of the inequalities 90 and (91) for intervals $[0, t]$ with $t \in[0, T] \backslash N$. With the arguments of Cor. 5.5 Item 1., one can consider the limit $t \nearrow 0$ and thus conclude that $z_{0}=\lim _{t \rightarrow 0} z(t)$ in $\mathbf{X}$ thanks to (90) and 91. Instead, for the final time T it may happen that $\mathrm{T} \in N$, so that 90 and 91 are not guaranteed. Since one can only consider the limit from the left for sequences $t \searrow \mathrm{~T}$, but not from the right, it is thus possible for $z \in B V\left([0, \mathrm{~T}], L^{1}(\Omega)\right)$ that $z_{\mathrm{T}}^{-}:=\lim _{t \rightarrow \mathrm{~T}} z(t)>z(\mathrm{~T})$ with $z(\mathrm{~T})$ the value extracted by convergences 76. A solution of 10 that is (Hölder-) continuous on all of $[0, \mathrm{~T}]$ can be rendered by replacing $z(\mathrm{~T})$ with $z_{\mathrm{T}}^{-}$.

### 5.4 Proof of Theorem5.1, Item 4: Improved convergence 79C

For the proof of the strong convergence 79a for the sequence $\left(\dot{u}_{\tau}\right)_{\tau}$ we refer to [LRTT18, L. 4.8].
To conclude the strong convergences 79b and 79c we shall exploit the validity of the energy-dissipation balance 10d at all $t \in[0, \mathrm{~T})$ for the limit pair $(u, z)$. More precisely, in view of the weak convergence results $\bar{u}_{\tau}(t) \rightharpoonup u(t)$ in $\mathbf{U}$ and $\bar{z}_{\tau}(t) \rightharpoonup z(t)$ in $\mathbf{X}$ by 76 d and 76 f in the separable, reflexive Banach spaces $\mathbf{U}, \mathbf{X}$ the strong convergence of the sequences can be concluded if also their norms can be shown to converge, i.e., if it can be shown that

$$
\begin{align*}
\|u(t)\|_{\mathbf{U}}^{2} \leq \liminf _{\tau \rightarrow 0}\left\|\bar{u}_{\tau}(t)\right\|_{\mathbf{U}}^{2} & \leq \limsup _{\tau \rightarrow 0}\left\|\bar{u}_{\tau}(t)\right\|_{\mathbf{U}}^{2} \leq\|z(t)\|_{\mathbf{U}}^{2}  \tag{121a}\\
\|z(t)\|_{\mathbf{X}}^{2} \leq \liminf _{\tau \rightarrow 0}\left\|\bar{z}_{\tau}(t)\right\|_{\mathbf{X}}^{2} & \leq \limsup _{\tau \rightarrow 0}^{\limsup }\left\|\bar{z}_{\tau}(t)\right\|_{\mathbf{X}}^{2} \leq\|z(t)\|_{\mathbf{X}}^{2} \tag{121b}
\end{align*}
$$

While the first set of inequalities in 121 is due to weak convergence and the weak lower semicontinuity of the norms, the last set of inequalities in 121 will now be concluded with the aid of the energy-dissipation balance of the limit system.

We first carry out the argument for $\left(\bar{z}_{\tau}\right)_{\tau}$ to deduce the last inequality in 121 b . For this, at any time $t \in[0, \mathrm{~T})$, we rearrange the discrete energy-dissipation inequality (42) as follows

$$
\begin{align*}
& \int_{\Omega}\left(\frac{1}{2 \ell}\left(1-\bar{z}_{\tau}(t)\right)^{2}+\frac{\ell}{2}\left|\nabla \bar{z}_{\tau}(t)\right|^{2}\right) \mathrm{d} x \\
& \leq \mathcal{K}\left(\dot{u}_{0}\right)+\mathcal{E}\left(0, u_{0}, z_{0}\right)-\int_{0}^{\bar{t}_{\tau}(t)}\left\langle\dot{f}_{\tau}(r), \underline{u}_{\tau}(r)\right\rangle_{\mathbf{U}^{*}, \mathbf{U}} \mathrm{~d} r \\
& \quad-\mathcal{K}\left(\dot{u}_{\tau}(t)\right)-\int_{\Omega} \frac{1}{2} \mathbb{C}\left(\bar{z}_{\tau}(t)\right) e\left(\bar{u}_{\tau}(t)\right): e\left(\bar{u}_{\tau}(t)\right) \mathrm{d} x+\left\langle\bar{f}_{\tau}(t), \bar{u}_{\tau}(t)\right\rangle_{\mathbf{U}^{*}, \mathbf{U}}  \tag{122}\\
& \quad-\int_{0}^{\bar{\tau}_{\tau}(t)} 2 \mathcal{R}_{M}\left(\dot{z}_{\tau}(r)\right) \mathrm{d} r-\int_{0}^{\bar{t}_{\tau}(t)} 2 \mathcal{V}\left(\bar{z}_{\tau}(r) ; \dot{u}_{\tau}(r)\right) \mathrm{d} r,
\end{align*}
$$

and we take the limit superior as $\tau \rightarrow 0$ on both sides of 122. By making use of convergences 76, we can pass to the limit on the right-hand side by weak lower semicontinuity and weak-strong convergence arguments, essentially by repeating the argumentation of Sec. 5.2.4 for the upper energy-dissipation estimate, and we also use the estimate
$-\int_{0}^{\bar{t}_{\tau}(t)} 2 \mathcal{R}_{M}\left(\dot{z}_{\tau}(r)\right) \mathrm{d} r \leq 0$. In this way we find

$$
\begin{aligned}
& \limsup _{\tau \downarrow 0} \int_{\Omega}\left(\frac{1}{2 \ell}\left(1-\bar{z}_{\tau}(t)\right)^{2}+\frac{\ell}{2}\left|\nabla \bar{z}_{\tau}(t)\right|^{2}\right) \mathrm{d} x \\
& \leq \mathcal{K}\left(\dot{u}_{0}\right)+\mathcal{E}\left(0, u_{0}, z_{0}\right)-\int_{0}^{t}\langle\dot{f}(r), u(r)\rangle_{\mathbf{U}^{*}, \mathbf{U}} \mathrm{~d} r-\mathcal{K}(\dot{u}(t)) \\
& \quad-\int_{\Omega} \frac{1}{2} \mathbb{C}(z(t)) e(u(t)): e(u(t)) \mathrm{d} x+\langle f(t), u(t)\rangle_{\mathbf{U}^{*}, \mathbf{U}}-\int_{0}^{t} 2 \mathcal{V}(z(r) ; \dot{u}(r)) \mathrm{d} r \\
& =\int_{\Omega}\left(\frac{1}{2 \ell}(1-z(t))^{2}+\frac{\ell}{2}|\nabla z(t)|^{2}\right) \mathrm{d} x
\end{aligned}
$$

for all $t \in[0, \mathrm{~T})$, where the last equality follows from the validity of the energy-dissipation balance 10d] of the limit. This provides 121b.

To deduce 121a we repeat the above line of arguments. Accordingly, in the analogon of 122 we keep the stored-elasticenergy term on the left-hand side and move the phase-field term to the right-hand side. In this term we can also pass to the limit via convergences (76) and weak lower semicontinuity, as already argued in Sec.5.2.4. Thus, we obtain

$$
\begin{align*}
& \limsup _{\tau \downarrow 0} \int_{\Omega} \frac{1}{2} \mathbb{C}\left(\bar{z}_{\tau}(t)\right) e\left(\bar{u}_{\tau}(t)\right): e\left(\bar{u}_{\tau}(t)\right) \mathrm{d} x \\
& \leq \mathcal{K}\left(\dot{u}_{0}\right)+\mathcal{E}\left(0, u_{0}, z_{0}\right)-\int_{0}^{t}\langle\dot{f}(r), u(r)\rangle_{\mathbf{U}^{*}, \mathbf{U}} \mathrm{~d} r-\int_{0}^{t} 2 \mathcal{V}(z(r) ; \dot{u}(r)) \mathrm{d} r \\
& \quad-\mathcal{K}(\dot{u}(t))-\int_{\Omega}\left(\frac{1}{2 \ell}\left(1-\bar{z}_{\tau}(t)\right)^{2}+\frac{\ell}{2}\left|\nabla \bar{z}_{\tau}(t)\right|^{2}\right) \mathrm{d} x+\langle f(t), u(t)\rangle_{\mathbf{U}^{*}, \mathbf{U}}  \tag{123}\\
& =\int_{\Omega} \frac{1}{2} \mathbb{C}(z(t)) e(u(t)): e(u(t)) \mathrm{d} x .
\end{align*}
$$

From this, 121a is concluded with the aid of the following lemma:
Lemma 5.6 (Adaption of [LRTT18 L. 4.7]). Given two constants $C_{1}, C_{2}$ with $0<C_{1} \leq C_{2}$, let $\mathcal{T}_{C_{1}, C_{2}}$ denote the class of tensors $\mathbb{C} \in \mathbb{R}^{d \times d \times d \times d}$ that are symmetric, i.e.,

$$
\mathbb{C}_{i j k l}=\mathbb{C}_{j i k l}=\mathbb{C}_{i j l k}=\mathbb{C}_{k l i j}
$$

positive definite and bounded:

$$
\begin{equation*}
C_{1}|A|^{2} \leq \mathbb{C} A: A \leq C_{2}|A|^{2} \quad \text { for every } A \in \mathbb{R}_{\mathrm{sym}}^{d \times d} \tag{124}
\end{equation*}
$$

Let $\mathcal{I}_{n}$ be the functional defined by

$$
\mathcal{I}_{n}(e):=\int_{\Omega} \mathbb{C}_{n}(x) e(x): e(x) \mathrm{d} x \quad \text { for every } e \in L^{2}\left(\Omega ; \mathbb{R}^{d \times d}\right)
$$

where $\mathbb{C}_{n} \in L^{\infty}\left(\Omega ; \mathcal{T}_{C_{1}, C_{2}}\right)$ are such that

$$
\begin{array}{rll}
\mathbb{C}_{n}(x) \rightarrow \mathbb{C}_{\infty}(x) & \text { for a.e. } x \in \Omega \\
& e_{n} \rightharpoonup e_{\infty} & \text { weakly in } L^{2}\left(\Omega ; \mathbb{R}^{d \times d}\right), \\
\limsup _{n \rightarrow \infty} \mathcal{I}_{n}\left(e_{n}\right) \leq \mathcal{I}_{\infty}\left(e_{\infty}\right), & \tag{125c}
\end{array}
$$

and $\mathcal{I}_{\infty}$ is defined by

$$
\mathcal{I}_{\infty}(e):=\int_{\Omega} \mathbb{C}_{\infty}(x) e(x): e(x) \mathrm{d} x \quad \text { for every } e \in L^{2}\left(\Omega ; \mathbb{R}^{d \times d}\right)
$$

Then, $\lim _{n \rightarrow \infty} \mathcal{I}_{n}\left(e_{n}\right)=\mathcal{I}_{\infty}\left(e_{\infty}\right)$ and

$$
\begin{equation*}
e_{n} \rightarrow e_{\infty} \quad \text { strongly in } L^{2}\left(\Omega ; \mathbb{R}^{d \times d}\right) . \tag{126}
\end{equation*}
$$

Note that [LRTT18] L. 4.7] states the result for tensors $\mathbb{C} \in L^{\infty}\left((0, \mathrm{~T}) \times \Omega ; \mathcal{T}_{C_{1}, C_{2}}\right)$ that additionally depend on time and for functions $e \in L^{2}\left((0, \mathrm{~T}) \times \Omega ; \mathbb{R}^{d \times d}\right)$, so that the functionals $\mathcal{I}_{n}, \mathcal{I}$ are defined by additionally integrating over $(0, \mathrm{~T})$. Accordingly, [LRTT18, L. 4.7] provides strong convergence of $\left(e_{n}\right)_{n}$ in $L^{2}\left((0, \mathrm{~T}) \times \Omega ; \mathbb{R}^{d \times d}\right)$. But the arguments of the proof remain valid, if we drop the time-dependence as here in Lemma 5.6 .

## 6 Limit passage in the viscous case

We now discuss the limit from time-discrete to time-continuous to obtain solutions for system

$$
\left(\mathbf{U}, \mathbf{W}, \mathbf{Z}_{M}, \mathcal{V}, \mathcal{K}, \mathcal{R}_{M}, \mathcal{E}\right)
$$

with a viscous evolution of the phase-field variable, when the parameter $M>0$ is kept fixed in the limit passage:
Theorem 6.1 (Existence of solutions in the viscous limit). Let the assumptions of Theorem 4.1 and Proposition 4.2 be satisfied and assume that the one-sided variational inequality (9a) holds true at $t=0$ for the initial datum $\left(u_{0}, z_{0}\right) \in$ $\mathbf{U} \times \mathbf{X}$. Let the viscosity parameter $M>0$ in 4] be fixed and let $\tau \rightarrow 0$. For all $\tau>0$ let $\left(\bar{u}_{\tau}, \underline{u}_{\tau}, u_{\tau}, \bar{z}_{\tau}, \underline{z}_{\tau}, z_{\tau}\right)$ be a tuple of interpolated solutions of problem (47) corresponding to system $\left(\mathbf{U}, \mathbf{W}, \mathbf{Z}_{M}, \mathcal{V}, \mathcal{K}, \mathcal{R}_{M}, \mathcal{E}\right)$. Then there holds:

1 There exists a pair $\left(u_{M}, z_{M}\right):[0, \mathbf{T}] \rightarrow \mathbf{U} \times \mathbf{Z}$ such that, up to a (not relabeled) subsequence, the solutions $\left(\bar{u}_{\tau}, \underline{u}_{\tau}, u_{\tau}, \bar{z}_{\tau}, \underline{z}_{\tau}, z_{\tau}\right)_{\tau}$ converge to $\left(u_{M}, z_{M}\right)$ in the topologies of 76 and additionally also in the following sense:

$$
\begin{equation*}
z_{\tau} \rightharpoonup z_{M} \quad \text { weakly in } H^{1}\left(0, T ; \mathbf{Z}_{M}\right) \tag{127}
\end{equation*}
$$

2 The limit pair $\left(u_{M}, z_{M}\right)$ is a solution of $\left(\mathbf{U}, \mathbf{W}, \mathbf{Z}_{M}, \mathcal{V}, \mathcal{K}, \mathcal{R}_{M}, \mathcal{E}\right)$ in the sense of Definition 1.2 and it is $0 \leq$ $z_{M}(t, x) \leq 1$ for a.a. $x \in \Omega$ and for all $t \in[0, \mathrm{~T}]$.
3 The limit function $u_{M}$ complies with the regularity properties (77). The limit function $z_{M}$ the has regularity properties

$$
\begin{equation*}
z_{M} \in H^{1}\left(0, \mathrm{~T} ; L^{2}(\Omega)\right) \cap L^{\infty}(0, \mathrm{~T} ; \mathbf{X}) \cap C^{0}((0, \mathrm{~T}) ; \mathbf{X}) \tag{128}
\end{equation*}
$$

4 In addition to the convergence results stated in Item 1, also the following improved convergence statements hold true:

$$
\begin{align*}
e\left(\dot{u}_{\tau}\right) \rightarrow e\left(\dot{u}_{M}\right) & \text { strongly in } H^{1}(0, \mathbf{T} ; \mathbf{U}),  \tag{129a}\\
e\left(\bar{u}_{\tau}(t)\right) \rightarrow e\left(u_{M}(t)\right) & \text { strongly in } \mathbf{U} \text { for all } t \in[0, \mathbf{T}),  \tag{129b}\\
\bar{z}_{\tau}(t) \rightarrow z_{M}(t) & \text { strongly in } \mathbf{X} \text { for all } t \in[0, \mathrm{~T}) . \tag{129c}
\end{align*}
$$

Proof. The proof of Theorem 6.1 is discussed in Section 6.2 by mainly pointing out the differences to the rate-independent case given in Theorem 5.1 The proof of the continuity of $z_{M}$ in the interval $[0, \mathrm{~T})$ with values in $\mathbf{X}$ is based on a similar argumentation as the improved regularity the rate-independent setting, cf. Theorem 5.2 We state the abstract result for the viscous evolution below in Theorem 6.2 and verify regularity statement 128 in Section 6.4

The proof of the continuity-result stated in Theorem 6.2 below will be elaborated in detail in Section 6.1 Compared to the regularity result in [RT17a, Thm. 3.8], the situation here is different due to a quadratic dissipation $\mathcal{R}_{M}$ instead of a 1-homogeneous rate-independent potential and due to the state-dependence of the viscous dissipation $\mathcal{V}$. The result is based on the one-sided variational inequality (9a, which is valid for a.e. $t \in(0, \mathrm{~T})$, only, due to the appearance of $\dot{z}_{M} \in L^{2}\left(0, \mathrm{~T} ; \mathbf{Z}_{M}\right)$. To estimate this expression we will make use of a Riemann-sum approach relying on a sequence of partitions $\Pi:=\left(\left\{t_{k}^{n}, k=0, \ldots n\right\}\right)_{n}$ for which (9a) holds true in each of the nodes $t_{k}^{n}$, see Thm. 6.2. Item 4 and also Remark6.3 An outcome of this will be the term

$$
\begin{equation*}
\operatorname{Var}_{\Pi, \mathbf{S}}^{\alpha}(z ;[s, t]):=\lim _{n \rightarrow \infty} \sum_{k=1}^{n}\left\|z\left(t_{k}^{n}\right)-z\left(t_{k-1}^{n}\right)\right\|_{\mathbf{S}}^{\alpha}, \quad \alpha>1, \tag{130}
\end{equation*}
$$

with the exponent $\alpha>1$ and the Banach space $\mathbf{S}$ given by the uniform convexity property [84. We remark that the expression $\operatorname{Var}_{\Pi, \mathbf{S}}^{\alpha}(z ;[s, t])$ resembles a variation of power $\alpha$, which appears in stochastics for $\alpha=2$, but differently to a true variation, in 130 it is not possible to consider the supremum over all the partitions of $[s, t]$.

Theorem 6.2 (Improved temporal regularity). Let $\left(\mathbf{U}, \mathbf{W}, \mathbf{Z}_{M}, \mathcal{V}, \mathcal{K}, \mathcal{R}_{M}, \mathcal{E}\right)$ be a damped inertial system characterized by Banach spaces $\mathbf{U}, \mathbf{Z}_{M}$, and a Hilbert space $\mathbf{W}$, the kinetic energy $\mathcal{K}: \mathbf{W} \rightarrow[0, \infty)$, a dissipation potential $\mathcal{V}: \mathbf{Z}_{M} \times \mathbf{U} \rightarrow[0, \infty)$, a quadratic dissipation potential $\mathcal{R}_{M}: \mathbf{Z}_{M} \rightarrow[0, \infty]$, and an energy functional $\mathcal{E}$ : $[0, \mathrm{~T}] \times \mathbf{U} \times \mathbf{Z}_{M} \rightarrow \mathbb{R} \cup\{\infty\}$ such that for all $t \in[0, \mathrm{~T}]$ the functional $\mathcal{E}(t, \cdot, \cdot)$ is coercive and takes finite values on
(a closed, convex subset of) $\mathbf{V} \times \mathbf{X}$ with $\mathbf{X}$ a Banach space such that $\mathbf{X} \subset \mathbf{Z}_{M}$ compactly and $\mathbf{V}$ a Banach space such that $\mathbf{V} \subset \mathbf{U}$ continuously and densely. Moreover, let $\mathbf{S}$ be a Banach space such that $\mathbf{X} \subseteq \mathbf{S} \subseteq \mathbf{Z}_{M}$ continuously, which may or may not coincide with $\mathbf{X}$ or $\mathbf{Z}_{M}$. Further consider the list of assumptions A1)-A10) from Theorem5.2 where A1) and A2) are now replaced by:
$\widetilde{A 1})$ The pair $(u, z):[0, \mathrm{~T}] \rightarrow \mathbf{U} \times \mathbf{X}$ satisfies the one-sided variational inequality (131) for a.a. $t \in[0, \mathrm{~T}]$ :

$$
\begin{equation*}
\left\langle\mathrm{D}_{z} \mathcal{E}(t, u(t), z(t))+\mathrm{D} \mathcal{R}_{M}(\dot{z}(t)), \eta\right\rangle_{\mathbf{x}^{*}, \mathbf{x}} \geq 0 \quad \text { for all } \eta \in \mathbf{K}(t) \tag{131}
\end{equation*}
$$

with $\mathbf{K}(t) \subset \mathbf{X}$ a closed, convex subset of $\mathbf{X}$. Define the $\mathcal{L}^{1}$-null set

$$
\begin{equation*}
\tilde{N}:=\{\hat{t} \in[0, \mathrm{~T}] \mid(u(\hat{t}), z(\hat{t})) \text { does not satisfy 131 }\} . \tag{132}
\end{equation*}
$$

$\widetilde{A 2}$ ) The pair $(u, z):[0, \mathrm{~T}] \rightarrow \mathbf{U} \times \mathbf{X}$ satisfies the following upper energy-dissipation estimate

$$
\begin{align*}
\mathcal{K}(\dot{u}(t)) & +\mathcal{E}(t, u(t), z(t))+\int_{s}^{t} 2\left(\mathcal{V}(z(r) ; \dot{u}(r))+\mathcal{R}_{M}(\dot{z}(r))\right) \mathrm{d} r \\
& \leq \mathcal{K}(\dot{u}(s))+\mathcal{E}(s, u(s), z(s))+\int_{s}^{t} \partial_{r} \mathcal{E}(r, u(r), z(r)) \mathrm{d} r \tag{133}
\end{align*}
$$

for all subintervals $[s, t] \subset[0, \mathrm{~T}]$ with $s, t \in[0, \mathrm{~T}] \backslash \widetilde{N}$.
The following statements hold true:
1 Let assumptions $\widetilde{A 1}$ ) and A5) be valid. Then $(u, z)$ satisfies

$$
\begin{align*}
& \mathcal{E}(s, u(s), z(s))+C_{\star}\|z(t)-z(s)\|_{\mathbf{S}}^{\alpha} \\
& \leq \mathcal{E}(s, u(s), z(t))+\left\langle\operatorname{DR}_{M}(\dot{z}(s)), z(t)-z(s)\right\rangle_{\mathbf{X}^{*}, \mathbf{X}} \tag{144}
\end{align*}
$$

for all $s \in[0, \mathrm{~T}] \backslash \widetilde{N}$ and for all $t \in[0, \mathrm{~T}]$ such that $(z(t)-z(s)) \in \mathbf{K}(s)$.
2 Let assumptions $\widetilde{A 1}), \widetilde{A 2}$ ), and A3)-A6) be valid. Then, $z$ complies with the following estimate

$$
\begin{align*}
C_{\star} & \|z(t)-z(s)\|_{\mathbf{S}}^{\alpha} \leq c_{\star}\left(\int_{s}^{t}\|\dot{u}(r)\|_{\mathbf{U}} \mathrm{d} r\right)^{\beta_{u}}+C(t-s)+\int_{s}^{t}\left|\langle\rho \ddot{u}(r), \dot{u}(r)\rangle_{\mathbf{U}^{*}, \mathbf{U}}\right| \mathrm{d} r  \tag{135}\\
& +\left\langle\mathrm{D} \mathcal{R}_{M}(\dot{z}(s)), z(t)-z(s)\right\rangle_{\mathbf{X}^{*}, \mathbf{X}}-\int_{s}^{t} 2 \mathcal{R}_{M}(\dot{z}(r)) \mathrm{d} r
\end{align*}
$$

for all subintervals $[s, t] \subset[0, \mathbf{T}]$ with $s, t \in[0, \mathbf{T}] \backslash \widetilde{N}$ and $(z(t)-z(s)) \in \mathbf{K}(s)$.
3 Let assumptions $\widetilde{A 1}$ ), $\widetilde{A 2}$ ) and A3)-A9) be valid. Then, $z$ complies with the estimate

$$
\begin{align*}
C_{\star} & \|z(t)-z(s)\|_{\mathbf{S}}^{\alpha} \leq \hat{C} \int_{s}^{t}\|\dot{u}(r)\|_{\mathbf{U}} \mathrm{d} r+c_{\star}\left(\int_{s}^{t}\|\dot{u}(r)\|_{\mathbf{U}} \mathrm{d} r\right)^{\beta_{u}}+C(t-s) \\
& +\left\langle\mathrm{D} \mathcal{R}_{M}(\dot{z}(s)), z(t)-z(s)\right\rangle_{\mathbf{X}^{*}, \mathbf{X}}-\int_{s}^{t} 2 \mathcal{R}_{M}(\dot{z}(r)) \mathrm{d} r \tag{136}
\end{align*}
$$

for all subintervals $[s, t] \subset[0, \mathrm{~T}]$ with $s, t \in[0, \mathbf{T}] \backslash \widetilde{N}$ and $(z(t)-z(s)) \in \mathbf{K}(s)$.
4 Let $\left[s_{*}, t_{*}\right] \subset[0, \mathrm{~T}]$ and consider a sequence of partitions $\Pi:=\left(\Pi_{n}\right)_{n \in \mathbb{N}}$ with $\Pi_{n}=\left\{s_{*}=t_{0}^{n}<t_{1}^{n}<\ldots<\right.$ $\left.t_{n}^{n}=t_{*}\right\}$ such that

$$
\begin{align*}
& \left(z\left(t_{k}^{n}\right)-z\left(t_{k-1}^{n}\right)\right) \in \mathbf{K}\left(t_{k-1}^{n}\right) \quad \text { for all } k \in\{1, \ldots, n\} \text { and } n \in \mathbb{N},  \tag{137a}\\
& \lim _{n \rightarrow \infty} \sum_{k=1}^{n}\left\langle\mathrm{D} \mathcal{R}_{M}\left(\dot{z}\left(t_{k-1}^{n}\right)\right), z\left(t_{k}^{n}\right)-z\left(t_{k}^{n}\right)\right\rangle_{\mathbf{X}^{*}, \mathbf{X}}-\int_{s_{*}}^{t^{*}} 2 \mathcal{R}_{M}(\dot{z}(r)) \mathrm{d} r=0 . \tag{137b}
\end{align*}
$$

Set

$$
\begin{equation*}
\operatorname{Var}_{\Pi, \mathbf{S}}^{\alpha}\left(z ;\left[s_{*}, t_{*}\right]\right):=\lim _{n \rightarrow \infty} \sum_{k=1}^{n}\left\|z\left(t_{k}^{n}\right)-z\left(t_{k-1}^{n}\right)\right\|_{\mathbf{S}}^{\alpha} \tag{138}
\end{equation*}
$$

Further suppose for the nodes of $\Pi$ that $t_{k}^{n} \in[0, \mathrm{~T}] \backslash \widetilde{N}$ for all $k \in\{0, \ldots, n\}$, and $n \in \mathbb{N}$. Assume that estimate 135 is valid with $\beta_{u}=1$ in all the nodes of $\Pi$. Then,

$$
\begin{equation*}
C_{\star} \operatorname{Var}_{\Pi, \mathbf{S}}^{\alpha}\left(z ;\left[s_{*}, t_{*}\right]\right) \leq c_{\star} \int_{s_{*}}^{t_{*}}\|\dot{u}(r)\|_{\mathbf{U}} \mathrm{d} r+C\left(t_{*}-s_{*}\right)+\int_{s_{*}}^{t_{*}}\left|\langle\rho \ddot{u}(r), \dot{u}(r)\rangle_{\mathbf{U}^{*}, \mathbf{U}}\right| \mathrm{d} r . \tag{139a}
\end{equation*}
$$

If estimate 136 is valid with $\beta_{u}=1$ in all the nodes of $\Pi$, then,

$$
\begin{equation*}
C_{\star} \operatorname{Var}_{\Pi, \mathbf{S}}^{\alpha}\left(z ;\left[s_{*}, t_{*}\right]\right) \leq\left(\hat{C}+c_{\star}\right) \int_{s_{*}}^{t_{*}}\|\dot{u}(r)\|_{\mathbf{U}} \mathrm{d} r+C\left(t_{*}-s_{*}\right) . \tag{139b}
\end{equation*}
$$

If in addition also assumption A10) is valid, then

$$
\begin{equation*}
C_{\star} \operatorname{Var}_{\Pi, \mathbf{S}}^{\alpha}\left(z ;\left[s_{*}, t_{*}\right]\right) \leq\left(\hat{C}+c_{\star}\right)\left(t_{*}-s_{*}\right)^{\frac{1}{2}}\|\dot{u}\|_{L^{2}\left(s_{*}, t_{*} ; \mathbf{U}\right)}+C\left(t_{*}-s_{*}\right) . \tag{139c}
\end{equation*}
$$

5 Let the conditions of Item 4 be valid and assume that one of 139a, 139b holds true. For all $\hat{t} \in \widetilde{N} \cap(0, \mathrm{~T})$ there are sequences $\left(\hat{t}_{l}^{ \pm}\right)_{l \in \mathbb{N}} \subset(0, \mathrm{~T}) \backslash \widetilde{N}$ such that

$$
\begin{align*}
& \hat{t}_{l}^{-} \nearrow \hat{t}, \quad \hat{t}_{l}^{+} \searrow \hat{t}, \text { and }\left\|z\left(\hat{t}_{l}^{+}\right)-z\left(\hat{t}_{l}^{-}\right)\right\|_{\mathbf{s}} \rightarrow 0, \\
& z_{\hat{t}}^{-}=\lim _{l \rightarrow \infty} z\left(\hat{t}_{l}^{-}\right)=\lim _{l \rightarrow \infty} z\left(\hat{t}_{l}^{+}\right)=z_{\hat{t}}^{+} \text {in } \mathbf{S} \text { as } l \rightarrow \infty . \tag{140}
\end{align*}
$$

6 Assume that $\mathcal{R}_{M}$, resp. the closed, convex subset $\mathbf{K}(t), t \in[0, \mathrm{~T}]$, encodes a unidirectionality constraint, i.e., $(z(\hat{t})-z(t)) \in \mathbf{K}(t)$ for all $\hat{t}, t \in[0, \mathbf{T}]$ with $\hat{t} \geq t$. Let the prerequisites of Item 5 be valid. Suppose that $\mathbf{Z}_{M}=L^{p}(\Omega)$ and that $\mathbf{S} \in\left\{L^{\tilde{p}}(\Omega), W^{m, \tilde{p}}(\Omega)\right\}$ with $p, \tilde{p}>1$ and $m \in \mathbb{N}$, and such that $\mathbf{X} \subseteq \mathbf{S} \subseteq \mathbf{Z}_{M}$ continuously. Then, it is $z_{\hat{t}}^{-}=z(\hat{t})=z_{\hat{t}}^{+}$in $\mathbf{S}$ for all $\hat{t} \in(0, \mathrm{~T})$ and for the left- and right-continuous limits of the sequence 140. Moreover, there even holds $z \in C^{0}((0, \mathrm{~T}) ; \mathbf{S})$.

Proof. The proof is carried out in Section 6.1 below.
Remark 6.3 (Approximation by Riemann sums). For a Banach space $V$, every $f \in L^{1}(0, T ; V)$ can be approximated by Riemann sums, i.e. there exists a sequence of partitions $\Pi_{n}=\left\{0=t_{0}^{n}<t_{1}^{n}<\ldots<t_{N_{n}}^{n}\right\}$ such that

$$
\begin{equation*}
\lim _{n \rightarrow \infty} \max _{1 \leq k \leq N_{n}} t_{k}^{n}-t_{k-1}^{n}=0 \tag{141}
\end{equation*}
$$

and $\lim _{n \rightarrow \infty} \sum_{k=1}^{N_{n}} \int_{t_{k-1}^{n}}^{t_{k}^{n}}\left\|f\left(t_{k}^{n}\right)-f(r)\right\| \mathrm{d} r=0$ [DMFT05 Lemma 4.12, p. 26]). There is even a freedom of choice in the selection of the partition because the approximation property also holds true if one takes into account almost all sequences of partitions with the property [141, cf. [MR15 footnote 35, p. 604]. This may be justified by applying for the $L^{1}(0, \mathrm{~T})$-integrable functions $\|f(\cdot)\|_{V}:[0, \mathrm{~T}] \rightarrow[0, \infty)$ the definition of gauge integrals, e.g. in the sense of DenjoyPerron [Maw97, p. 349] or Henstock-Kurzweil [ebPM16] Ch. 4], and the fact that every Lebesgue-integrable function is gauge-integrable in the sense of Denjoy-Perron [Maw97, p. 385f] or Henstock-Kurzweil [Sch09]. In this way one may restrict the partitions to those with nodes in $[0, \mathrm{~T}] \backslash \widetilde{N}$ and thus ensure the prerequisites of Thm. 6.2 Item 4

### 6.1 Proof of Theorem 6.2: Improved temporal regularity for the internal variable

To Item 1, estimate 134: Based on $\widetilde{A 1}$ ), we test the variational inequality 131 at time $s \in[0, \mathrm{~T}] \backslash \tilde{N}$ by $\tilde{z}-z(s) \in$ $\mathbf{K}(s)$ with $\tilde{z} \in \mathbf{X}$ suitably. By the Gâteaux-differentiablility and convexity of $\mathcal{E}(t, u, \cdot)$ ensured by A 5$)$, one finds

$$
\begin{align*}
0 & \leq\left\langle\mathrm{D}_{z} \mathcal{E}(s, u(s), z(s))+\mathrm{D} \mathcal{R}_{M}(\dot{z}(s)), \tilde{z}-z(s)\right\rangle_{\mathbf{X}^{*}, \mathbf{X}} \\
& \leq \mathcal{E}(s, u(s), \tilde{z})-\mathcal{E}(s, u(s), z(s))+\left\langle\mathrm{D} \mathcal{R}_{M}(\dot{z}(s)), \tilde{z}-z(s)\right\rangle_{\mathbf{X}^{*}, \mathbf{X}} \tag{142}
\end{align*}
$$

Let now $z_{0}, z_{1} \in \mathbf{X}$ such that $z_{i}-z(s) \in \mathbf{K}(s)$ for $i \in\{0,1\}$ and $\lambda \in(0,1)$. Then, for $\tilde{z}=\lambda z_{1}+(1-\lambda) z_{0}$ in 142, it is $\tilde{z}-z(s) \in \mathbf{K}(s)$. Exploiting the uniform convexity estimate 84, it follows

$$
\begin{align*}
0 \leq & \mathcal{E}(s, u(s), \tilde{z})-\mathcal{E}(s, u(s), z(s))+\left\langle\mathrm{D}_{M}(\dot{z}(s)), \tilde{z}-z(s)\right\rangle_{\mathbf{X}^{*}, \mathbf{X}} \\
\leq & \lambda \mathcal{E}\left(s, u(s), z_{1}\right)+(1-\lambda) \mathcal{E}\left(s, u(s), z_{0}\right)-\lambda(1-\lambda) C_{\star}\left\|z_{1}-z_{0}\right\|_{\mathbf{S}}^{\alpha}-\mathcal{E}(s, u(s), z(s))  \tag{143}\\
& +\lambda\left\langle\mathrm{D} \mathcal{R}_{M}(\dot{z}(s)), z_{1}-z(s)\right\rangle_{\mathbf{X}^{*}, \mathbf{X}}+(1-\lambda)\left\langle\mathrm{D} \mathcal{R}_{M}(\dot{z}(s)), z_{0}-z(s)\right\rangle_{\mathbf{X}^{*}, \mathbf{X}}
\end{align*}
$$

Now, the choice $z_{0}:=z(s)$ in 143, where clearly $z(s)-z(s)=0 \in \mathbf{K}(s)$, leads to

$$
\begin{aligned}
0 \leq \lambda & {\left[\mathcal{E}\left(s, u(s), z_{1}\right)-\mathcal{E}(s, u(s), z(s))-(1-\lambda) C_{\star}\left\|z_{1}-z(s)\right\|_{\mathbf{S}}^{\alpha}\right.} \\
& \left.+\left\langle\mathrm{D} \mathcal{R}_{M}(\dot{z}(s)), z_{1}-z(s)\right\rangle_{\mathbf{X}^{*}, \mathbf{X}}\right] .
\end{aligned}
$$

Dividing by $\lambda>0$ and letting $\lambda \downarrow 0$ one arrives at

$$
C_{\star}\left\|z_{1}-z(s)\right\|_{\mathbf{S}}^{\alpha} \leq \mathcal{E}\left(s, u(s), z_{1}\right)-\mathcal{E}(s, u(s), z(s))+\left\langle\mathrm{D} \mathcal{R}_{M}(\dot{z}(s)), z_{1}-z(s)\right\rangle_{\mathbf{X}^{*}, \mathbf{X}} .
$$

The choice $z_{1}:=z(t)$ for $t \in[0, \mathrm{~T}]$ such that $(z(t)-z(s)) \in \mathbf{K}(s)$ shows the validity of Theorem 6.2 Item 1 that is

$$
\begin{equation*}
C_{\star}\|z(t)-z(s)\|_{\mathbf{S}}^{\alpha} \leq \mathcal{E}(s, u(s), z(t))-\mathcal{E}(s, u(s), z(s))+\left\langle\mathbf{D}_{M}(\dot{z}(s)), z(t)-z(s)\right\rangle_{\mathbf{X}^{*}, \mathbf{X}} \tag{144}
\end{equation*}
$$

To Item 2, estimate 135: Let now also $t \in[0, T] \backslash \widetilde{N}$. In a first step, the right-hand side of 144] by adding and subtracting terms, can be rewritten as

$$
\begin{align*}
144=\mathcal{E}( & t, u(t), z(t))-\mathcal{E}(s, u(s), z(s))+\int_{s}^{t} 2 \mathcal{R}_{M}(\dot{z}(r)) \mathrm{d} r \\
& +\mathcal{E}(s, u(s), z(t))-\mathcal{E}(t, u(t), z(t))  \tag{145}\\
& +\left\langle\mathrm{D} \mathcal{R}_{M}(\dot{z}(s)), z(t)-z(s)\right\rangle_{\mathbf{X}^{*}, \mathbf{X}}-\int_{s}^{t} 2 \mathcal{R}_{M}(\dot{z}(r)) \mathrm{d} r .
\end{align*}
$$

In view of the upper energy-dissipation estimate $\sqrt{133}$ ensured in $\widetilde{A 2}$ ) for $s, t \in[0, \mathrm{~T}] \backslash \widetilde{N}$ one obtains

$$
\begin{align*}
145 \leq & \mathcal{K}(\dot{u}(s))-\mathcal{K}(\dot{u}(t))-\int_{s}^{t} 2 \mathcal{V}(z(r) ; \dot{u}(r)) \mathrm{d} r+\int_{s}^{t} \partial_{r} \mathcal{E}(r, u(r), z(r)) \mathrm{d} r \\
& +\mathcal{E}(s, u(s), z(t))-\mathcal{E}(t, u(t), z(t))  \tag{146}\\
& +\left\langle\mathrm{D} \mathcal{R}_{M}(\dot{z}(s)), z(t)-z(s)\right\rangle_{\mathbf{X}^{*}, \mathbf{X}}-\int_{s}^{t} 2 \mathcal{R}_{M}(\dot{z}(r)) \mathrm{d} r .
\end{align*}
$$

Now the terms on the right-hand side of (146] will be further estimated from above individually. In view of assumption A3) on the regularity of $u$, the result [Rou06, Lemma 7.3, p. 191] together with the non-negativity of $\mathcal{V}(z(r) ; \dot{u}(r))$, provides that

$$
\begin{equation*}
\mathcal{K}(\dot{u}(s))-\mathcal{K}(\dot{u}(t))-\int_{s}^{t} 2 \mathcal{V}(z(r) ; \dot{u}(r)) \mathrm{d} r \leq \int_{s}^{t}\left|\langle\rho \ddot{u}(r), \dot{u}(r)\rangle_{\mathbf{U}^{*}, \mathbf{U}}\right| \mathrm{d} r . \tag{147}
\end{equation*}
$$

In addition, we make use of the absolute continuity of $r \mapsto \mathcal{E}(r, u, z)$ and Hölder-estimate 85 for $\mathcal{E}(t, \cdot, z(t))$ provided by A6), to deduce that

$$
\begin{align*}
& \mathcal{E}(s, u(s), z(t))-\mathcal{E}(t, u(t), z(t)) \\
& =\mathcal{E}(s, u(s), z(t))-\mathcal{E}(t, u(s), z(t))+\mathcal{E}(t, u(s), z(t))-\mathcal{E}(t, u(t), z(t))  \tag{148}\\
& \leq-\int_{s}^{t} \partial_{r} \mathcal{E}(r, u(s), z(t)) \mathrm{d} r+c_{\star}\|u(s)-u(t)\|_{\mathbf{U}}^{\beta_{u}},
\end{align*}
$$

and by the absolute continuity of $u$ we further note that

$$
\begin{equation*}
c_{\star}\|u(s)-u(t)\|_{\mathbf{U}}^{\beta_{u}} \leq c_{\star}\left\|\int_{s}^{t} \dot{u}(r) \mathrm{d} r\right\|_{\mathbf{U}}^{\beta_{u}} \leq c_{\star}\left(\int_{s}^{t}\|\dot{u}(r)\|_{\mathbf{U}} \mathrm{d} r\right)^{\beta_{u}} \tag{149}
\end{equation*}
$$

In summary, we conclude for all $s, t \in[0, \mathrm{~T}] \backslash \widetilde{N}$ with $(z(t)-z(s)) \in \mathbf{K}(s)$ that

$$
\begin{align*}
C_{\star}\|z(t)-z(s)\|_{\mathbf{S}}^{\alpha} \leq & \int_{s}^{t}\left|\langle\rho \ddot{u}(r), \dot{u}(r)\rangle_{\mathbf{U}^{*}, \mathbf{U}}\right| \mathrm{d} r+c_{\star}\left(\int_{s}^{t}\|\dot{u}(r)\|_{\mathbf{U}} \mathrm{d} r\right)^{\beta_{u}} \\
& +\int_{s}^{t}\left(\partial_{r} \mathcal{E}(r, u(r), z(r))-\partial_{r} \mathcal{E}(r, u(s), z(t))\right) \mathrm{d} r  \tag{150}\\
& +\left\langle\mathrm{D} \mathcal{R}_{M}(\dot{z}(s)), z(t)-z(s)\right\rangle_{\mathbf{X}^{*}, \mathbf{X}}-\int_{s}^{t} 2 \mathcal{R}_{M}(\dot{z}(r)) \mathrm{d} r
\end{align*}
$$

where the term involving the partial time derivatives of $\mathcal{E}$ can be further estimated from above by the power control 83 provided in assumption A4) as follows

$$
\begin{align*}
& \left|\int_{s}^{t} \partial_{r} \mathcal{E}(r, u(r), z(r))-\partial_{r} \mathcal{E}(r, u(s), z(t)) \mathrm{d} r\right| \\
& \leq \int_{s}^{t}\left(\left|\partial_{r} \mathcal{E}(r, u(r), z(r))\right|+\left|\partial_{r} \mathcal{E}(r, u(s), z(t))\right|\right) \mathrm{d} r  \tag{151}\\
& \leq \int_{s}^{t} \tilde{c}[\mathcal{E}(r, u(r), z(r))+\mathcal{E}(r, u(s), z(t))+2 \hat{c}] \mathrm{d} r \leq C(t-s) .
\end{align*}
$$

Note here that the uniform bound on $\mathcal{E}(r, u(r), z(r))+\mathcal{E}(r, u(s), z(t))$ is guaranteed by the upper energy-dissipation estimate $\sqrt{133}$ and the coercivity of $\mathcal{E}(t, \cdot, \cdot)$ on (a closed, convex subset of) $\mathbf{V} \times \mathbf{X}$ as claimed in the general assumptions of Thm. 6.2 Inserting 151 into 150 proves the validity of estimate 135 for all $s, t \in[0, \mathrm{~T}] \backslash \widetilde{N}$ such that $(z(t)-z(s)) \in$ $\mathbf{K}(s)$, that is Thm. 6.2 Item 2
To Item 3 estimate 136: To deduce (136) we return to estimate 146 and, instead of using 147, we argue as follows: Again, by assumption A3) on the regularity of $u$ and Rou06, Lemma 7.3, p. 191] we have $\mathcal{K}(\dot{u}(s))-\mathcal{K}(\dot{u}(t))=$ $-\int_{s}^{t}\langle\rho \ddot{u}(r), \dot{u}(r)\rangle_{\mathbf{U}^{*}, \mathbf{U}} \mathrm{~d} r$. Moreover, $\mathcal{E}(r, \cdot, z(r))$ is Gâteaux-differentiable by A7) and the weak momentum balance 87) holds true by assumption A9). We thus test 87) by $\dot{u}$ to obtain the identity

$$
\int_{s}^{t}\left\langle\rho \ddot{u}(r)+\mathrm{D}_{u} \mathcal{E}(r, u(r), z(r)), \dot{u}(r)\right\rangle_{\mathbf{U}^{*}, \mathbf{U}} \mathrm{~d} r=-\int_{s}^{t} 2 \mathcal{V}(z(t) ; \dot{u}(r)) \mathrm{d} r .
$$

Hence, the kinetic and the viscous terms on the right-hand side of 146 amount to

$$
\begin{align*}
& \mathcal{K}(\dot{u}(s))-\mathcal{K}(\dot{u}(t))-\int_{s}^{t} 2 \mathcal{V}(z(r) ; \dot{u}(r)) \mathrm{d} r \\
& =\int_{s}^{t}\left\langle-\rho \ddot{u}(r)+\rho \ddot{u}(r)+\mathrm{D}_{u} \mathcal{E}(r, u(r), z(r)), \dot{u}(r)\right\rangle_{\mathbf{U}^{*}, \mathbf{U}} \mathrm{~d} r  \tag{152}\\
& =\int_{s}^{t}\left\langle\mathrm{D}_{u} \mathcal{E}(r, u(r), z(r)), \dot{u}(r)\right\rangle_{\mathbf{U}^{*}, \mathbf{U}} \mathrm{~d} r .
\end{align*}
$$

This term is now further estimated with the aid of the gradient estimate 86 provided in A8) in the following way:

$$
\begin{align*}
& \left|\int_{s}^{t}\left\langle\mathrm{D}_{u} \mathcal{E}(r, u(r), z(r)), \dot{u}(r)\right\rangle_{\mathbf{U}^{*}, \mathbf{U}} \mathrm{~d} r\right| \leq \int_{s}^{t}\left\|\mathrm{D}_{u} \mathcal{E}(r, u(r), z(r))\right\|_{\mathbf{U}^{*}}\|\dot{u}(r)\|_{\mathbf{U}} \mathrm{d} r  \tag{153}\\
& \leq \int_{s}^{t}\left(\hat{C}_{1} \mathcal{E}(r, u(r), z(r))+\hat{C}_{2}\|u(r)\|_{\mathbf{U}}+\hat{C}_{3}\right)^{1 / \sigma}\|\dot{u}(r)\|_{\mathbf{U}} \mathrm{d} r \leq \hat{C} \int_{s}^{t}\|\dot{u}(r)\|_{\mathbf{U}} \mathrm{d} r,
\end{align*}
$$

where the uniform boundedness of $u \in H^{1}(0, \mathrm{~T} ; \mathbf{U})$ claimed in A3) was used together with the uniform bound on the energy provided by the upper energy-dissipation estimate 82, Putting together estimates 146, 148, 149, 151, and 153) results in

$$
\begin{align*}
C_{\star}\|z(t)-z(s)\|_{\mathbf{S}}^{\alpha} \leq & \hat{C} \int_{s}^{t}\|\dot{u}(r)\|_{\mathbf{U}} \mathrm{d} r+c_{\star}\left(\int_{s}^{t}\|\dot{u}(r)\|_{\mathbf{U}} \mathrm{d} r\right)^{\beta_{u}}+C(t-s)  \tag{154}\\
& +\left\langle\mathrm{D} \mathcal{R}_{M}(\dot{z}(s)), z(t)-z(s)\right\rangle_{\mathbf{X}^{*}, \mathbf{X}}-\int_{s}^{t} 2 \mathcal{R}_{M}(\dot{z}(r)) \mathrm{d} r
\end{align*}
$$

which finishes the proof of estimate 136 for all $s, t \in[0, \mathrm{~T}] \backslash \tilde{N}$ with $(z(t)-z(s)) \in \mathbf{K}(s)$, i.e., Thm. 6.2 Item 3
To Item 44, estimates 139: Consider now a sequence of partitions $\Pi=\left(\Pi_{n}\right)_{n \in \mathbb{N}}, \Pi_{n}:=\left\{s_{*}=t_{0}^{n}<t_{1}^{n}<\ldots<\right.$ $\left.t_{n}^{n}=t_{*}\right\}$ with the properties 137 and such that $t_{k}^{n} \in[0, T] \backslash \widetilde{N}$ for all the nodes of $\Pi$. First, assume that estimate 135 is valid with $\beta_{u}=1$ for all the nodes of $\Pi$. Hence, using $s=t_{k-1}^{n}, t=t_{k}^{n}$ and $\beta_{u}=1$ in 135, summing up from $k=1$
to $n$, and letting $n \rightarrow \infty$, gives

$$
\begin{align*}
& C_{\star} \operatorname{Var}_{\Pi, \mathbf{S}}^{\alpha}\left(z ;\left[s_{*}, t_{*}\right]\right) \leq c_{\star} \int_{s_{*}}^{t_{*}}\|\dot{u}(r)\|_{\mathbf{U}} \mathrm{d} r+C\left(t_{*}-s_{*}\right)+\int_{s_{*}}^{t_{*}}\left|\langle\rho \ddot{u}(r), \dot{u}(r)\rangle_{\mathbf{U}^{*}, \mathbf{U}}\right| \mathrm{d} r \\
& \quad+\lim _{n \rightarrow \infty} \sum_{k=1}^{n}\left\langle\mathrm{D} \mathcal{R}_{M}\left(\dot{z}\left(t_{k-1}^{n}\right)\right), z\left(t_{k}^{n}\right)-z\left(t_{k-1}^{n}\right)\right\rangle_{\mathbf{X}^{*}, \mathbf{X}}-\int_{s_{*}}^{t_{*}} 2 \mathcal{R}_{M}(\dot{z}(r)) \mathrm{d} r  \tag{155}\\
& \quad=c_{\star} \int_{s_{*}}^{t_{*}}\|\dot{u}(r)\|_{\mathbf{U}} \mathrm{d} r+C\left(t_{*}-s_{*}\right)+\int_{s_{*}}^{t_{*}}\left|\langle\rho \ddot{u}(r), \dot{u}(r)\rangle_{\mathbf{U}^{*}, \mathbf{U}}\right| \mathrm{d} r
\end{align*}
$$

by assumption on the convergence of the Riemann sum in 137b. This shows 139a. Analogously one obtains from estimate 136 with $\beta_{u}=1$ that

$$
\begin{align*}
& C_{\star} \operatorname{Var}_{\Pi, \mathbf{S}}^{\alpha}\left(z ;\left[s_{*}, t_{*}\right]\right) \leq \hat{C} \int_{s_{*}}^{t_{*}}\|\dot{u}(r)\|_{\mathbf{U}} \mathrm{d} r+c_{\star} \int_{s_{*}}^{t_{*}}\|\dot{u}(r)\|_{\mathbf{U}} \mathrm{d} r+C\left(t_{*}-s_{*}\right) \\
& \quad+\lim _{n \rightarrow \infty} \sum_{k=1}^{n}\left\langle\mathrm{D} \mathcal{R}_{M}\left(\dot{z}\left(t_{k-1}^{n}\right)\right), z\left(t_{k}^{n}\right)-z\left(t_{k-1}^{n}\right)\right\rangle_{\mathbf{X}^{*}, \mathbf{X}}-\int_{s_{*}}^{t_{*}} 2 \mathcal{R}_{M}(\dot{z}(r)) \mathrm{d} r  \tag{156}\\
& \quad=\left(\hat{C}+c_{\star}\right) \int_{s_{*}}^{t_{*}}\|\dot{u}(r)\|_{\mathbf{U}} \mathrm{d} r+C\left(t_{*}-s_{*}\right)
\end{align*}
$$

that is 139b. For estimate 139 c we observe from the quadratic growth 88 of $\mathcal{V}$ claimed in $\mathrm{A10}$ ) that we may use Hölder's inequality with power $p=2$ for the first term on the right-hand side of 139b, resp. above in 156. Thus,

$$
\begin{align*}
& C_{\star} \operatorname{Var}_{\Pi, \mathbf{S}}^{\alpha}\left(z ;\left[s_{*}, t_{*}\right]\right) \leq\left(\hat{C}+c_{\star}\right) \int_{s_{*}}^{t_{*}}\|\dot{u}(r)\|_{\mathbf{U}} \mathrm{d} r+C\left(t_{*}-s_{*}\right)  \tag{157}\\
& \leq\left(\hat{C}+c_{\star}\right)\left(t_{*}-s_{*}\right)^{\frac{1}{2}}\|\dot{u}\|_{L^{2}\left(s_{*}, t_{*} ; \mathbf{U}\right)}+C\left(t_{*}-s_{*}\right),
\end{align*}
$$

which is 139c
To Item 5. existence of S-convergent sequences [140): Let $\hat{t} \in \widetilde{N} \cap(0, \mathrm{~T})$ and consider a sequence $\varepsilon \searrow 0$ with $\varepsilon>0$ and such that $\hat{t}-\varepsilon, \hat{t}+\varepsilon \in[0, \mathrm{~T}] \backslash \tilde{N}$. This is possible in view of Remark 6.3 Assume that one of 139a, 139 b is valid. Without loss of generality we here carry out the proof under the assumption that 139b is valid together with growth property 88 from A10); the proof based on 139a or without 88 proceeds in an analogous way. Then, by assumption, there exists partitions $\left(\Pi_{n}^{\varepsilon}\right)_{n \in \mathbb{N}}=\left\{\hat{t}-\varepsilon=t_{0}^{\varepsilon n}<t_{1}^{\varepsilon n}<\ldots<t_{n}^{\varepsilon n}=\hat{t}+\varepsilon\right\}$ with nodes $t_{k}^{\varepsilon n} \in[0, \mathrm{~T}] \backslash \widetilde{N}$. Hence, 139b, resp. 156 above, together with 88, yields that

$$
\begin{aligned}
& \quad \operatorname{Var}_{\Pi, \mathbf{S}}^{\alpha}(z ;[\hat{t}-\varepsilon, \hat{t}+\varepsilon])=\lim _{n \rightarrow \infty} \sum_{k=1}^{n}\left\|z\left(t_{k}^{\varepsilon n}\right)-z\left(t_{k-1}^{\varepsilon n}\right)\right\|_{\mathbf{S}}^{\alpha} \\
& \leq \frac{1}{C_{\star}}\left(\left(\hat{C}+c_{\star}\right)(2 \varepsilon)^{\frac{1}{2}}\|\dot{u}\|_{L^{2}(0, \mathbf{T} ; \mathbf{U})}+C 2 \varepsilon\right. \\
& \left.\quad+\lim _{n \rightarrow \infty} \sum_{k=1}^{n}\left\langle\mathrm{D} \mathcal{R}_{M}\left(\dot{z}\left(t_{k-1}^{n}\right)\right), z\left(t_{k}^{n}\right)-z\left(t_{k-1}^{n}\right)\right\rangle_{\mathbf{X}^{*}, \mathbf{X}}-\int_{s_{*}}^{t_{*}} 2 \mathcal{R}_{M}(\dot{z}(r)) \mathrm{d} r\right),
\end{aligned}
$$

where we also divided by $C_{\star}$ and used that $[\hat{t}-\varepsilon, \hat{t}+\varepsilon] \subset[0, \mathrm{~T}]$. In view of 137b), for all $\nu>0$ and each $\varepsilon>0$ there is an index $n(\nu, \varepsilon) \in \mathbb{N}$ such that

$$
\begin{equation*}
\sum_{k=1}^{n}\left\langle\mathrm{D} \mathcal{R}_{M}\left(\dot{z}\left(t_{k-1}^{n}\right)\right), z\left(t_{k}^{n}\right)-z\left(t_{k-1}^{n}\right)\right\rangle_{\mathbf{X}^{*}, \mathbf{X}}-\int_{s_{*}}^{t_{*}} 2 \mathcal{R}_{M}(\dot{z}(r))<\nu \tag{158}
\end{equation*}
$$

for all $n \geq n(\nu, \varepsilon)$ such that $\Pi_{n}^{\varepsilon}$ is an admissible partition of $[\hat{t}-\varepsilon, \hat{t}+\varepsilon]$. In particular, also the choice $\nu=\varepsilon$ is possible. In this way, for each $\varepsilon>0$ we have found an index $n(\varepsilon)=n(\varepsilon, \varepsilon) \in \mathbb{N}$ marking the partition $\Pi_{n(\varepsilon)}^{\varepsilon}$ and constants
$C_{1}, C_{2}>0$ such that

$$
\begin{align*}
\sum_{k=1}^{n(\varepsilon)}\left\|z\left(t_{k}^{\varepsilon n}\right)-z\left(t_{k-1}^{\varepsilon n}\right)\right\|_{\mathrm{S}}^{\alpha} & \leq \frac{1}{C_{\star}}\left(\left(\hat{C}+c_{\star}\right)(2 \varepsilon)^{\frac{1}{2}}\|\dot{u}\|_{L^{2}(0, \mathbf{T} ; \mathbf{U})}+C 2 \varepsilon+\varepsilon\right)  \tag{159}\\
& \leq C_{1}(2 \varepsilon)^{\frac{1}{2}}+C_{2} \varepsilon .
\end{align*}
$$

Moreover, there is an index $k(\varepsilon) \in\{1, \ldots, n(\varepsilon)\}$ such that $\hat{t} \in\left[t_{k(\varepsilon)-1}^{\varepsilon n}, t_{k(\varepsilon)}^{\varepsilon n}\right]$. Hence,

$$
\left\|z\left(t_{k(\varepsilon)}^{\varepsilon n}\right)-z\left(t_{k(\varepsilon)-1}^{\varepsilon n}\right)\right\|_{\mathbf{S}}^{\alpha} \leq \sum_{k=1}^{n(\varepsilon)}\left\|z\left(t_{k}^{\varepsilon n}\right)-z\left(t_{k-1}^{\varepsilon n}\right)\right\|_{\mathbf{S}}^{\alpha} \leq C_{1}(2 \varepsilon)^{\frac{1}{2}}+C_{2} \varepsilon
$$

Choosing now a subsequence $\left(\varepsilon_{l}\right)_{l \in \mathbb{N}}$ with $\varepsilon_{l} \rightarrow 0$ as $l \rightarrow \infty$, and $\hat{t}_{l}^{-}:=t_{k\left(\varepsilon_{l}\right)-1}^{\varepsilon_{l} n}$ as well as $\hat{t}_{l}^{+}:=t_{k\left(\varepsilon_{l}\right)}^{\varepsilon_{l} n}$ proves the existence of sequences $\left(\hat{t}_{l}^{ \pm}\right)_{l \in \mathbb{N}} \subset[0, \mathrm{~T}] \backslash \tilde{N}$ such that $\hat{t}_{l}^{-} \nearrow \hat{t}$ and $\hat{t}_{l}^{+} \searrow \hat{t}$, and such that also $\| z\left(t_{k(\varepsilon)}^{\varepsilon n}\right)-$ $z\left(t_{k(\varepsilon)-1}^{\varepsilon n}\right) \|_{\mathbf{s}} \rightarrow 0$, and thus $z_{\hat{t}}^{-}=\lim _{l \rightarrow \infty} z\left(\hat{t}_{l}^{-}\right)=\lim _{l \rightarrow \infty} z\left(\hat{t}_{l}^{+}\right)=z_{\hat{t}}^{+}$, i.e., with properties 140. This finishes the proof of Thm. 6.2. Item[5.
To Item 6, continuity of the internal variable: Given the prerequisites of Item 5 for every $\hat{t} \in(0, T)$ we find sequences $\left(\hat{t}_{l}^{-}\right)_{l \in \mathbb{N}},\left(\hat{t}_{l}^{+}\right)_{l \in \mathbb{N}}$ such that $\hat{t}_{l}^{-} \nearrow \hat{t}$ and $\hat{t}_{l}^{+} \searrow \hat{t}$, and such that $z_{\hat{t}}^{-}=\lim _{l \rightarrow \infty} z\left(\hat{t}_{l}^{-}\right)=\lim _{l \rightarrow \infty} z\left(\hat{t}_{l}^{+}\right)=z_{\hat{t}}^{+}$in $\mathbf{S}$. Like in Corollary 5.5, we now exploit the unidirectionality of $\mathcal{R}_{M}$ to show that indeed

$$
\begin{equation*}
z_{\hat{t}}^{-}=\lim _{l \rightarrow \infty} z\left(\hat{t}_{l}^{-}\right)=z(\hat{t})=\lim _{l \rightarrow \infty} z\left(\hat{t}_{l}^{+}\right)=z_{\hat{t}}^{+} \quad \text { in } \mathbf{S} . \tag{160}
\end{equation*}
$$

For this, we argue as follows: Since $\mathbf{S} \subset \mathbf{Z}_{M}$ continuously, we also have $z_{\hat{t}}^{-}=z_{\hat{t}}^{+}$in $\mathbf{Z}_{M}$. Moreover, by the unidirectionality constraint we have $\left(z(\hat{t})-z\left(\hat{t}_{l}^{-}\right)\right) \in \mathbf{K}\left(\hat{t}_{l}^{-}\right),\left(z\left(\hat{t}_{l}^{+}\right)-z\left(\hat{t}_{l}^{-}\right)\right) \in \mathbf{K}\left(\hat{t}_{l}^{-}\right)$and $\left(z\left(\hat{t}_{l}^{+}\right)-z(\hat{t})\right) \in \mathbf{K}(\hat{t})$. Hence $z\left(\hat{t}_{l}^{-}\right) \preceq z(\hat{t}) \preceq z\left(\hat{t}_{l}^{+}\right)$for all $l \in \mathbb{N}$, where $\preceq$ indicates the symbol for the unidirectionality relation. Thus $z_{\hat{t}}^{-} \preceq z(\hat{t}) \preceq z_{\hat{t}}^{+}=z_{\hat{t}}^{-}$, which implies

$$
\begin{equation*}
z_{\hat{t}}^{-}=z(\hat{t})=z_{\hat{t}}^{+}, \text {first in } \mathbf{Z}_{M}=L^{p}(\Omega) \tag{161}
\end{equation*}
$$

By assumption, it is $\mathbf{S}=W^{m, \tilde{p}}(\Omega)$ with $\mathbf{X} \subseteq \mathbf{S} \subseteq Z_{M}$. Hence, equality 161 also holds true in $\mathbf{S}$ if $m=0$. Moreover, for $m>0$ we also find equality (161, to hold true in $\mathbf{S}$ by the uniqueness of weak derivatives. This proves 160.
The convergence (160) along the special sequences $\left(\hat{t}_{l}^{ \pm}\right)_{l \in \mathbb{N}} \subset[0, T] \backslash \widetilde{N}$ will be used now to show continuity of $z$ in $(0, \mathrm{~T})$. For that, consider a general sequence

$$
\begin{equation*}
\left(\hat{s}^{l}\right)_{l \in \mathbb{N}} \subset(0, T) \text { such that } \hat{s}^{l} \rightarrow \hat{t} \text { as } l \rightarrow \infty, \tag{162a}
\end{equation*}
$$

i.e., here in particular also $s^{l} \in \tilde{N}$ is allowed, and we aim to prove that also

$$
\begin{equation*}
z\left(\hat{s}^{l}\right) \rightarrow z(\hat{t}) \quad \text { as } l \rightarrow \infty \tag{162b}
\end{equation*}
$$

Now, let $\left(\hat{t}_{j}\right)_{j \in \mathbb{N}} \subset(0, T) \backslash \widetilde{N}$ denote the special sequence $\left(\hat{t}_{l}^{-}\right)_{l \in \mathbb{N}}$ with 160 obtained by the construction in Item 5 i.e., we have

$$
\begin{equation*}
\hat{t}_{j} \rightarrow \hat{t} \text { and } z\left(\hat{t}_{j}\right) \rightarrow z(\hat{t}) . \tag{163}
\end{equation*}
$$

By construction of Item 5 for each $j \in \mathbb{N}$ there is a partition $\Pi_{n(j)}^{\varepsilon}$ such that $\hat{t}_{j}=t_{k-1}^{\varepsilon n(j)}$ and $\hat{t} \in\left[t_{k-1}^{\varepsilon n(j)}, t_{k}^{\varepsilon n(j)}\right]$ for some $k \in\{1, \ldots, n(j)\}$ and such that

$$
\begin{equation*}
\sum_{k=1}^{n(j)}\left\langle\mathrm{D} \mathcal{R}_{M}\left(\dot{z}\left(t_{k-1}^{n}\right)\right), z\left(t_{k}^{n}\right)-z\left(t_{k-1}^{n}\right)\right\rangle_{\mathbf{X}^{*}, \mathbf{X}}-\int_{\hat{t}+\varepsilon}^{\hat{t}-\varepsilon} 2 \mathcal{R}_{M}(\dot{z}(r))<\varepsilon \tag{164}
\end{equation*}
$$

since $n(j) \geq n(\varepsilon, \varepsilon)$ in view of 158. Similarly, for each $\hat{s}^{l}$, for all $l \in \mathbb{N}$ there is also a special sequence $\left(\hat{s}_{i}^{l}\right)_{i \in \mathbb{N}} \subset$ $(0, T) \backslash \widetilde{N}$ such that

$$
\hat{s}_{i}^{l} \rightarrow \hat{s}^{l} \text { as } i \rightarrow \infty \text { and } z\left(\hat{s}_{i}^{l}\right) \rightarrow z\left(\hat{s}^{l}\right) .
$$

Let $\tilde{\varepsilon} \in(0, \varepsilon]$ be general but fixed. Then, for all $l \in \mathbb{N}$ there is an index $i(l, \tilde{\varepsilon}) \in \mathbb{N}$ and there is an index $j(\tilde{\varepsilon}) \in \mathbb{N}$ such that

$$
\begin{align*}
& \text { for all } i>i(l, \tilde{\varepsilon}):\left\|z\left(\hat{s}_{i}^{l}\right)-z\left(\hat{s}^{l}\right)\right\|_{\mathbf{S}}<\tilde{\varepsilon},  \tag{165a}\\
& \text { for all } j>j(\tilde{\varepsilon}):\left\|z\left(\hat{t}_{j}\right)-z(\hat{t})\right\|_{\mathbf{S}}<\tilde{\varepsilon} . \tag{165b}
\end{align*}
$$

Now we also fix $j>j(\tilde{\varepsilon})$ and we know that there is a partition $\Pi_{n(j)}^{\varepsilon}$ such that $\hat{t}_{j}$ coincides with one of its nodes, in particular $\hat{t}_{j}=t_{k-1}^{\varepsilon n(j)}$ by construction. Then, one finds $l \in \mathbb{N}$ large enough such that $\hat{s}^{l} \in\left[t_{k-1}^{\varepsilon n(j)}, t_{k}^{\varepsilon n(j)}\right]$ and also $\hat{s}_{i}^{l} \in\left[t_{k-1}^{\varepsilon n(j)}, t_{k}^{\varepsilon n(j)}\right]$, in addition to 165a. Thanks to this, we estimate

$$
\begin{aligned}
\left\|z\left(\hat{s}^{l}\right)-z(\hat{t})\right\|_{\mathbf{S}} & \leq\left\|z\left(\hat{s}^{l}\right)-z\left(\hat{s}_{i}^{l}\right)\right\|_{\mathbf{S}}+\left\|z\left(\hat{s}_{i}^{l}\right)-z(\hat{t})\right\|_{\mathbf{S}} \\
& \leq \tilde{\varepsilon}+\left\|z\left(\hat{s}_{i}^{l}\right)-z\left(t_{k-1}^{\varepsilon n(j)}\right)\right\|_{\mathbf{S}}+\left\|z\left(t_{k-1}^{\varepsilon n(j)}\right)-z(\hat{t})\right\|_{\mathbf{S}} \\
& \leq 2 \tilde{\varepsilon}+\left\|z\left(\hat{s}_{i}^{l}\right)-z\left(t_{k-1}^{\varepsilon n(j)}\right)\right\|_{\mathbf{S}}
\end{aligned}
$$

where we again used 165. From this, it follows

$$
\begin{equation*}
\left\|z\left(\hat{s}^{l}\right)-z(\hat{t})\right\|_{\mathbf{S}}^{\alpha} \leq 2^{\alpha-1}\left((2 \tilde{\varepsilon})^{\alpha}+\left\|z\left(\hat{s}_{i}^{l}\right)-z\left(t^{\varepsilon n(j)}{ }_{k-1}\right)\right\|_{\mathbf{S}}^{\alpha}\right) \tag{166}
\end{equation*}
$$

and it remains to deduce an estimate for the term $\left\|z\left(\hat{s}_{i}^{l}\right)-z\left(t_{k-1}^{n(j)}\right)\right\|_{\mathbf{S}}^{\alpha}$. Thanks to $\hat{s}_{i}^{l}, t_{k-1}^{n(j)} \in(0, \mathrm{~T}) \backslash \tilde{N}$ this can be achieved with the aid of 136, keeping in mind that here $\beta_{u}=1$. Hence, it follows that

$$
\begin{align*}
C_{\star} & \left\|z\left(\hat{s}_{i}^{l}\right)-z\left(t_{k-1}^{\varepsilon n(j)}\right)\right\|_{\mathbf{S}}^{\alpha} \leq\left(\hat{C}+c_{\star}\right) \int_{t_{k-1}^{\varepsilon n(j)}}^{\hat{s}_{i}^{l}}\|\dot{u}(r)\|_{\mathbf{U}} \mathrm{d} r+C\left(\hat{s}_{i}^{l}-t_{k-1}^{\varepsilon n(j)}\right) \\
& +\left\langle\mathrm{D} \mathcal{R}_{M}\left(\dot{z}\left(t_{k-1}^{\varepsilon n(j)}\right)\right), z\left(\hat{s}_{i}^{l}\right)-z\left(t_{k-1}^{\varepsilon n(j)}\right)\right\rangle_{\mathbf{X}^{*}, \mathbf{X}}-\int_{t_{k-1}^{\varepsilon n(j)}}^{\hat{s}_{i}^{l}} 2 \mathcal{R}_{M}(\dot{z}(r)) \mathrm{d} r . \tag{167}
\end{align*}
$$

In order to further estimate 167 from above, we once more make use of the unidirectionality constraint. For this, we need to distinguish the following two cases: decay, i.e., for all $t_{1}<t_{2} \in[0, \mathrm{~T}]$ it is $z\left(t_{1}\right) \geq z\left(t_{2}\right)$ a.e. $\in \Omega$ together with $\dot{z} \leq 0$ a.e. in $(0, \mathrm{~T}) \times \Omega$, and growth, i.e., for all $t_{1}<t_{2} \in[0, \mathrm{~T}]$ it is $z\left(t_{1}\right) \leq z\left(t_{2}\right)$ a.e. $\in \Omega$ together with $\dot{z} \geq 0$ a.e. in $(0, \mathrm{~T}) \times \Omega$. We evaluate these two cases for the times $t_{k-1}^{\varepsilon n(j)} \leq \hat{s}_{i}^{l} \leq t_{k}^{\varepsilon n(j)}$. In case of decay we thus have $z\left(t_{k-1}^{\varepsilon n(j)}\right) \geq z\left(\hat{s}_{i}^{l}\right) \geq z\left(t_{k}^{\varepsilon n(j)}\right)$ and hence $0 \geq z\left(\hat{s}_{i}^{l}\right)-z\left(t_{k-1}^{\varepsilon n(j)}\right) \geq z\left(t_{k}^{\varepsilon n(j)}\right)-z\left(t_{k-1}^{\varepsilon n(j)}\right)$. Together with $\mathrm{D} \mathcal{R}_{M}\left(\dot{z}\left(t_{k-1}^{\varepsilon n(j)}\right)\right) \leq 0$ we see that

$$
\begin{align*}
0 & \leq\left\langle\mathrm{D} \mathcal{R}_{M}\left(\dot{z}\left(\varepsilon t_{k-1}^{\varepsilon n(j)}\right)\right), z\left(\hat{s}_{i}^{l}\right)-z\left(t_{k-1}^{\varepsilon n(j)}\right)\right\rangle_{\mathbf{X}^{*}, \mathbf{X}} \\
& \leq\left\langle\mathrm{D} \mathcal{R}_{M}\left(\dot{z}\left(t_{k-1}^{\varepsilon n(j)}\right)\right), z\left(t_{k}^{\varepsilon n(j)}\right)-z\left(t_{k-1}^{\varepsilon n(j)}\right)\right\rangle_{\mathbf{X}^{*}, \mathbf{X}} \tag{168}
\end{align*}
$$

Analogously, in case of growth we have $z\left(t_{k-1}^{\varepsilon n(j)}\right) \leq z\left(\hat{s}_{i}^{l}\right) \leq z\left(t_{k}^{\varepsilon n(j)}\right)$ and hence $0 \leq z\left(\hat{s}_{i}^{l}\right)-z\left(t_{k-1}^{\varepsilon n(j)}\right) \leq z\left(t_{k}^{\varepsilon n(j)}\right)-$ $z\left(t_{k-1}^{\varepsilon n(j)}\right)$. Together with $\mathrm{D} \mathcal{R}_{M}\left(\dot{z}\left(t_{k-1}^{\varepsilon n(j)}\right)\right) \geq 0$ we again observe 168 to hold true.
Inserting 168 into 167) and exploiting the additivity of the integral gives

$$
\begin{align*}
& C_{\star} \| \\
& \quad+\left(\hat{s}_{i}^{l}\right)-z\left(t_{k-1}^{\varepsilon n(j)}\right)\left\|_{\mathbf{S}}^{\alpha} \leq\left(\hat{C}+c_{\star}\right) \int_{t_{k-1}^{\varepsilon n(j)}}^{t_{k}^{\varepsilon n(j)}}\right\| \dot{u}(r) \|_{\mathbf{U}} \mathrm{d} r+C\left(t_{k}^{\varepsilon n(j)}-t_{k-1}^{\varepsilon n(j)}\right)  \tag{169}\\
& \\
& \quad+\left\langle\mathrm{D} \mathcal{R}_{M}\left(\dot{z}\left(t_{k-1}^{\varepsilon n(j)}\right)\right), z\left(t_{k}^{\varepsilon n(j)}\right)-z\left(t_{k-1}^{\varepsilon n(j)}\right)\right\rangle_{\mathbf{X}^{*}, \mathbf{X}}-\int_{t_{k-1}^{\varepsilon n(j)}}^{t_{k}^{\varepsilon n(j)}} 2 \mathcal{R}_{M}(\dot{z}(r)) \mathrm{d} r \\
& \\
& \quad+\int_{\hat{s}_{i}^{l}}^{t_{k}^{\varepsilon n(j)}} 2 \mathcal{R}_{M}(\dot{z}(r)) \mathrm{d} r .
\end{align*}
$$

We add the analogous estimates 136 for each of the nodes $\tilde{k} \neq k \in\{1, \ldots, n(j)\}$ to 169 and divide the result by $C_{\star}$. In this way we obtain

$$
\begin{aligned}
& \left\|z\left(\hat{s}_{i}^{l}\right)-z\left(t_{k-1}^{\varepsilon n(j)}\right)\right\|_{\mathbf{S}}^{\alpha} \leq\left\|z\left(\hat{s}_{i}^{l}\right)-z\left(t_{k-1}^{\varepsilon n(j)}\right)\right\|_{\mathbf{S}}^{\alpha}+\sum_{\substack{\tilde{k}=1 \\
\tilde{k} \neq k}}^{n(j)}\left\|z\left(t_{k}^{\varepsilon n(j)}\right)-z\left(t_{k-1}^{\varepsilon n(j)}\right)\right\|_{\mathbf{S}}^{\alpha} \\
& \leq \\
& \quad \frac{1}{C_{\star}}\left(\left(\hat{C}+c_{\star}\right) \sum_{\tilde{k}=1}^{n(j)} \int_{t_{\tilde{k}-1}^{\varepsilon n(j)}}^{t_{\tilde{k}}^{\varepsilon n(j)}}\|\dot{u}(r)\|_{\mathbf{U}} \mathrm{d} r+C \sum_{\tilde{k}=1}^{n(j)}\left(t_{\tilde{k}}^{\varepsilon n(j)}-t_{\tilde{k}-1}^{\varepsilon n(j)}\right)\right. \\
& \quad+\sum_{\tilde{k}=1}^{n(j)}\left(\left\langle\mathrm{D} \mathcal{R}_{M}\left(\dot{z}\left(t_{\tilde{k}-1}^{\varepsilon n(j)}\right)\right), z\left(t_{\tilde{k}}^{\varepsilon n(j)}\right)-z\left(t_{\tilde{k}-1}^{\varepsilon n(j)}\right)\right\rangle_{\mathbf{X}^{*}, \mathbf{X}}-\int_{t_{\tilde{k}-1}^{\varepsilon n(j)}}^{t_{\tilde{k}}^{\varepsilon n(j)}} 2 \mathcal{R}_{M}(\dot{z}(r)) \mathrm{d} r\right) \\
& \left.\quad+\int_{\hat{s}_{\hat{k}}^{l}}^{t_{k}^{\varepsilon n(j)}} 2 \mathcal{R}_{M}(\dot{z}(r)) \mathrm{d} r\right) \\
& \leq \frac{1}{C_{\star}}\left(\left(\hat{C}+c_{\star}\right) \int_{\hat{t}-\varepsilon}^{\hat{t}+\varepsilon}\|\dot{u}(r)\|_{\mathbf{U}} \mathrm{d} r+C 2 \varepsilon+\varepsilon+\int_{\hat{s}_{i}^{l}}^{t_{k}^{\varepsilon n(j)}} 2 \mathcal{R}_{M}(\dot{z}(r)) \mathrm{d} r\right) \\
& \leq \\
& C_{1}(2 \varepsilon)^{1 / 2}+C_{2} \varepsilon+\frac{1}{C_{\star}} \int_{\hat{s}_{i}^{l}}^{t_{k}^{\varepsilon n(j)}} 2 \mathcal{R}_{M}(\dot{z}(r)) \mathrm{d} r .
\end{aligned}
$$

Here we used 164 and growth estimate (88), similarly as for 159. Putting this together with 166 we find

$$
\begin{align*}
\left\|z\left(\hat{s}^{l}\right)-z(\hat{t})\right\|_{\mathbf{S}}^{\alpha} & \leq 2^{\alpha-1}\left((2 \tilde{\varepsilon})^{\alpha}+\left\|z\left(\hat{s}_{i}^{l}\right)-z\left(t_{k-1}^{n(j)}\right)\right\|_{\mathbf{S}}^{\alpha}\right) \\
& \leq 2^{\alpha-1}\left((2 \tilde{\varepsilon})^{\alpha}+C_{1}(2 \varepsilon)^{1 / 2}+C_{2} \varepsilon+\frac{1}{C_{\star}} \int_{\hat{s}_{i}^{l}}^{t_{k}^{\varepsilon n(j)}} 2 \mathcal{R}_{M}(\dot{z}(r)) \mathrm{d} r\right), \tag{170}
\end{align*}
$$

where $\tilde{\varepsilon} \in(0, \varepsilon]$ and $\left[\hat{s}_{i}^{l}, t_{k}^{\varepsilon n(j)}\right] \subset\left[t_{k-1}^{\varepsilon n(j)}, t_{k}^{\varepsilon n(j)}\right] \subset[\hat{t}-\varepsilon, \hat{t}+\varepsilon]$. Hence, by the absolute continuity of the integral, the right-hand side of (170) can be made arbitrarily small as $\varepsilon \rightarrow 0$. This shows that indeed 162 holds true for any sequence $\left(\hat{s}^{l}\right)_{l} \subset(0, \mathrm{~T})$ with $\hat{s}^{l} \rightarrow \hat{t} \in(0, \mathrm{~T})$ as $l \rightarrow \infty$. Thus we are now in the position to conclude that $z \in C^{0}((0, \mathrm{~T}) ; \mathbf{S})$.

### 6.2 Proof of Theorem6.1: Viscous case

We carry out the proof of Thm. 6.1 following the lines of Sections $5.1-5.4$ by pointing out the arguments which have to be done in a different way due to the presence of the quadratic dissipation potential $\mathcal{R}_{M}: \mathbf{Z}_{M} \rightarrow[0, \infty)$. In particular, in view of the uniform a priori bounds [48, the convergence of a subsequence of the interpolated solutions $\left(\bar{u}_{\tau}, \underline{u}_{\tau}, u_{\tau}, \bar{z}_{\tau}, \underline{z}_{\tau}, z_{\tau}\right)_{\tau}$ to a limit pair $\left(u_{M}, z_{M}\right)$ in the topologies 76 is concluded in the same way as already done in Section 5.1 Also the boundedness $0 \leq z_{M}(t, x) \leq 1$ for a.e. $x \in \Omega$ and for all $t \in[0, \mathrm{~T}]$ is concluded here like in Section 5.2.1 from the knowledge of this bound for the approximants $\left(\bar{z}_{\tau}(t)\right)_{\tau}$ together with the strong $L^{2}(\Omega)$-convergence of this sequence ensured by 76 g for all $t \in[0, \mathrm{~T}]$.
Proof of Theorem6.1 Item 1. Convergence statement 127. For fixed $M>0$ the uniform a priori bound

$$
\left\|z_{\tau}\right\|_{H^{1}\left(0, \mathrm{~T} ; L^{2}(\Omega)\right)} \leq C / \sqrt{M}
$$

provided in 48 g implies the existence of $\tilde{z} \in H^{1}\left(0, \mathrm{~T} ; \mathbf{Z}_{M}\right)$ such that, up to a subsequence, $z_{\tau} \rightharpoonup \tilde{z}$ weakly in $H^{1}\left(0, \mathrm{~T} ; \mathbf{Z}_{M}\right)$. It has to be concluded that $\tilde{z}$ coincides in with $z_{M}$, the latter already obtained by convergences 76f76h. Indeed, by the definition of the interpolants 43, it is $z_{\tau}(t)-\bar{z}_{\tau}(t)=\left(t-t_{\tau}^{k}\right) \dot{z}_{\tau}(t)$ for any $t \in\left(t_{\tau}^{k-1}, t_{\tau}^{k}\right]$, and in view of the bound 48g it thus follows

$$
\begin{aligned}
& \int_{0}^{\top} \int_{\Omega}\left(\tilde{z}-z_{M}\right) v \mathrm{~d} x \mathrm{~d} t=\lim _{\tau \rightarrow 0} \int_{0}^{\top} \int_{\Omega}\left(z_{\tau}(t)-\bar{z}_{\tau}(t)\right) v(t) \mathrm{d} x \mathrm{~d} t \\
& \leq \lim _{\tau \rightarrow 0} \int_{0}^{\top} \int_{\Omega}\left(\tau \dot{z}_{\tau}\right) v(t) \mathrm{d} x \mathrm{~d} t \leq \lim _{\tau \rightarrow 0} \tau\left\|\dot{z}_{\tau}\right\|_{L^{2}((0, \mathrm{~T}) \times \Omega)}\|v\|_{L^{2}((0, \mathrm{~T}) \times \Omega)}=0
\end{aligned}
$$

for all $v \in L^{2}((0, \mathrm{~T}) \times \Omega)$, which proves the assertion.
Proof of Theorem 6.1. Item 2: Defining properties (9) of the solution. As $\tau \rightarrow 0$ the weak balance of momentum 9c) is obtained from its time-discrete version (47b) thanks to convergences 76 by repeating the lines of Section 5.2.2 Also an upper energy-dissipation estimate for all $t \in[0, \mathrm{~T}]$ can be deduced following the arguments of Section 5.2.4 by exploiting the lower semicontinuity properties of the functionals $\mathcal{K}, \mathcal{E}(t, \cdot, \cdot)$, and $\int_{0}^{t} 2 \mathcal{V}(\cdot ; \cdot) \mathrm{d} r$ with respect to convergences (76), the non-negativity of the Yosida-term $\int_{0}^{t} \int_{\Omega} \frac{N_{\tau}}{2}\left(\dot{z}_{\tau}\right)_{+} \mathrm{d} x \mathrm{~d} r \geq 0$, together with the lower semicontinuity of the quadratic dissipation $\int_{0}^{t} \int_{\Omega} \frac{M}{2}(\cdot) \mathrm{d} x \mathrm{~d} r$ with respect to the weak $L^{2}((0, \mathrm{~T}) \times \Omega)$-convergence obtained in 127. For all $t \in[0, \mathrm{~T}]$ this results in the upper energy-dissipation estimate

$$
\begin{align*}
& \mathcal{K}\left(\dot{u}_{M}(t)\right)+\mathcal{E}\left(t, u_{M}(t), z_{M}(t)\right)+\int_{0}^{t} 2\left(\mathcal{V}\left(z_{M} ; \dot{u}_{M}\right)+\mathcal{R}_{M}\left(\dot{z}_{M}\right)\right) \mathrm{d} r  \tag{171}\\
& \quad \leq \mathcal{K}\left(\dot{u}_{0}\right)+\mathcal{E}\left(0, u_{0}, z_{0}\right)+\int_{0}^{t} \partial_{t} \mathcal{E}(r, u(r), z(r)) \mathrm{d} r
\end{align*}
$$

The opposite inequality will be deduced below in 173 with the aid of a Riemann-sum argument once the one-sided variational inequality (9a) is verified.
Unidirectionality (9b. The deduction of the a priori bounds 48 was carried out in Section 4.6 and also led to the estimates (72) and 74). The latter yields $\int_{0}^{\top} \int_{\Omega}\left|\left(\dot{z}_{\tau}\right)_{+}\right|^{2} \mathrm{~d} x \mathrm{~d} r \leq \frac{C}{N_{\tau}}=C \tau$ for all $\tau>0$. Hence, by lower semi-continuity of the map $z \mapsto \int_{0}^{\top} \int_{\Omega}\left|(z)_{+}\right|^{2} \mathrm{~d} x \mathrm{~d} r$ with respect to weak $L^{2}((0, \mathrm{~T}) \times \Omega)$-convergence, it follows by convergence (127)

$$
\begin{equation*}
0=\lim _{\tau \rightarrow 0} C \tau=\liminf _{\tau \rightarrow 0} \int_{0}^{\top} \int_{\Omega}\left|\left(\dot{z}_{\tau}(r)\right)_{+}\right|^{2} \mathrm{~d} x \mathrm{~d} r \geq \int_{0}^{\top} \int_{\Omega}\left|\left(\dot{z}_{M}(r)\right)_{+}\right|^{2} \mathrm{~d} x \mathrm{~d} r \tag{172}
\end{equation*}
$$

Since $\int_{\Omega}\left|\left(\dot{z}_{M}(r)\right)_{+}\right|^{2} \mathrm{~d} x \geq 0$ for all $r \in[0, \mathrm{~T}]$, by the non-negativity of the integrand $\left|\left(\dot{z}_{M}(r)\right)_{+}\right|^{2}$ we conclude from (172) that there has to hold $\int_{\Omega}\left|\left(\dot{z}_{M}(r)\right)_{+}\right|^{2} \mathrm{~d} x=0$ for a.a. $r \in[0, \mathrm{~T}]$, and also $\int_{\Omega}\left(\dot{z}_{M}(r)\right)_{+} \mathrm{d} x=0$ for a.a. $r \in[0, \mathrm{~T}]$ by Hölder's inequality. Consider now any interval $[s, t] \subset[0, \mathrm{~T}]$. Then, by the convexity of the function $(\cdot)_{+}$and Jensen's inequality we deduce

$$
\int_{\Omega}\left(z_{M}(t)-z_{M}(s)\right)_{+} \mathrm{d} x=\int_{\Omega}\left(\int_{s}^{t} \dot{z}_{M}(r) \mathrm{d} r\right)_{+} \mathrm{d} x \leq \int_{s}^{t} \int_{\Omega}\left(\dot{z}_{M}(r)\right)_{+} \mathrm{d} x \mathrm{~d} r=0
$$

which proves that $z_{M}(t) \leq z_{M}(s)$ a.e. in $\Omega$ for all $s<t \in[0, \mathrm{~T}]$.
Viscous phase-field evolution 9a] for a.a. $t \in[0, \mathrm{~T})$. Also the limit passage in the time-discrete damage evolution (47a) to the viscous evolution (9a) is proven similar to the rate-independent case. We thus proceed along the lines of Section 5.2: Testing (47a) with $\eta \in \mathbf{Y}$ such that $\eta \leq 0$ a.e. in $\Omega$, omitting the negative term $\int_{\Omega} N_{\tau}\left(\dot{z}_{\tau}\right)_{+} \eta \mathrm{d} x$, and integrating over an arbitrary measurable set $I \subset[0, \mathrm{~T}]$ one arrives at the inequality 108 , i.e.,

$$
\begin{aligned}
& \int_{I} \int_{\Omega}\left[-\frac{1}{\ell}\left(1-\bar{z}_{\tau}(t)\right)+M \dot{z}_{\tau}(t)\right] \eta+\ell \nabla \bar{z}_{\tau}(t) \cdot \nabla \eta \mathrm{d} x \mathrm{~d} t \\
& \quad \geq \int_{I} \int_{\Omega}\left[\frac{1}{2} \mathbb{C}^{\prime}\left(\bar{z}_{\tau}(t)\right) e\left(\underline{u}_{\tau}(t)\right): e\left(\underline{u}_{\tau}(t)\right)\right](-\eta) \mathrm{d} x \mathrm{~d} t
\end{aligned}
$$

To pass to the limit one uses the lower and upper semicontinuity arguments from 109-112. Yet, for the limit passage in the viscous term the argument from 110 is replaced in view of weak convergence 127] by the following

$$
\int_{I} \int_{\Omega} M \dot{z}_{\tau} \eta \mathrm{d} x \mathrm{~d} r \rightarrow \int_{I} \int_{\Omega} M \dot{z}_{M} \eta \mathrm{~d} x \mathrm{~d} r .
$$

In this way one obtains the time-integrated one-sided variational inequality

$$
\begin{gathered}
\int_{I} \int_{\Omega}\left[\frac{1}{2} \mathbb{C}^{\prime}\left(z_{M}(t)\right) e\left(u_{M}(t)\right): e\left(u_{M}(t)\right)-\frac{1}{\ell}\left(1-z_{M}(t)\right)+M \dot{z}_{M}\right] \eta d x \mathrm{~d} t \\
+\int_{I} \int_{\Omega} \ell \nabla z_{M}(t) \cdot \nabla \eta d x \mathrm{~d} t \geq 0
\end{gathered}
$$

to hold for every measurable set $I \subset[0, \mathrm{~T}]$. From this, we conclude the assertion, i.e., that the one-sided variational inequality (9a) holds true for a.e. $t \in[0, \mathrm{~T}$ ).
Energy-dissipation balance (9d for a.a. $t \in[0, \mathrm{~T})$. In view of 171 it now remains to show the opposite estimate

$$
\begin{align*}
& \mathcal{K}\left(\dot{u}_{M}(t)\right)+\mathcal{E}\left(t, u_{M}(t), z_{M}(t)\right)+\int_{0}^{t} 2\left(\mathcal{V}\left(z_{M} ; \dot{u}_{M}\right)+\mathcal{R}_{M}\left(\dot{z}_{M}\right)\right) \mathrm{d} r  \tag{173}\\
& \quad \geq \mathcal{K}\left(\dot{u}_{0}\right)+\mathcal{E}\left(0, u_{0}, z_{0}\right)+\int_{0}^{t} \partial_{t} \mathcal{E}(r, u(r), z(r)) \mathrm{d} r .
\end{align*}
$$

Like for the rate-independent setting in Section 5.2 .4 we will first obtain 173 to hold for a.e. $t \in[0, \mathrm{~T})$, only. In analogy to these arguments the proof for 173 also uses a Riemann-sum argument applied to the one-sided variational inequality 9a that was shown above to be valid for a.e. $t \in[0, \mathrm{~T})$, only. Let $\widetilde{N} \subset[0, \mathrm{~T}]$ denote the $\mathcal{L}^{1}$-null set for which 9a) does not hold and consider any $t \in(0, T] \backslash \tilde{N}$. Then, thanks to Remark 6.3 we find a sequence of (not necessarily uniform) partitions $\Pi_{\theta}=\left\{0=t_{\theta}^{0}<t_{\theta}^{1}<\ldots<t_{\theta}^{N_{\theta}}=t\right\}$ with (possibly variable) step-size $\theta_{k}=t_{\theta}^{k}-t_{\theta}^{k-1}$, $\theta=\max _{k \in\left\{1, \ldots, N_{\theta}\right\}}\left|t_{\theta}^{k}-t_{\theta}^{k-1}\right|$ and $\theta \downarrow 0$ as $N_{\theta} \rightarrow \infty$ such that $t_{\theta}^{k} \in[0, \mathrm{~T}) \backslash \tilde{N}$ and such that

$$
\begin{gather*}
\begin{array}{c}
\sum_{k=1}^{N_{\theta}} \theta_{k} \int_{\Omega}\left(\frac{1}{2} \mathbb{C}\left(z_{M}\left(t_{\theta}^{k}\right)\right) \frac{\left|e\left(u_{M}\left(t_{\theta}^{k-1}\right)\right)\right|^{2}-\left|e\left(u_{M}\left(t_{\theta}^{k}\right)\right)\right|^{2}}{\theta_{k}}+M \dot{z}_{M}\left(t_{\theta}^{k-1}\right) \frac{z_{M}\left(t_{\theta}^{k}\right)-z_{M}\left(t_{\theta}^{k-1}\right)}{\theta_{k}}\right) \mathrm{d} x \mathrm{~d} r \\
\downarrow \theta \rightarrow 0 \\
\int_{0}^{\top} \int_{\Omega}\left(-\mathbb{C}\left(z_{M}(r) e\left(u_{M}(r)\right): e\left(\dot{u}_{M}(r)\right)\right)+M\left|\dot{z}_{M}(r)\right|^{2}\right) \mathrm{d} x \mathrm{~d} r .
\end{array} .
\end{gather*}
$$

Now we test the one-sided variational inequality 9a) at time $t_{\theta}^{k-1}$ by $z_{\theta}^{k}$, sum up over $k \in\left\{1, \ldots, N_{\theta}\right\}$ and take the limit $\theta \rightarrow 0$. Thanks to the convergence of the Riemann-sums 174 this results in

$$
\begin{aligned}
\mathcal{E}(0, u(0), s(0)) \leq & \mathcal{E}(t, u(t), z(t))+\int_{0}^{t} 2 \mathcal{R}_{M}\left(\dot{z}_{M}(r)\right) \mathrm{d} r \\
& -\int_{0}^{t} \int_{\Omega} \mathbb{C}(z(r)) e(u(r)): e(\dot{u}(r)) \mathrm{d} x \mathrm{~d} r \\
& +\int_{0}^{t}\langle f(r), \dot{u}(r)\rangle_{\mathbf{U}^{*}, \mathbf{U}} \mathrm{~d} r-\int_{0}^{t} \partial_{t} \mathcal{E}(r, u(r), s(r)) \mathrm{d} r,
\end{aligned}
$$

which is the viscous analogon of 118 . This is combined with 119, the latter obtained by testing the weak momentum balance 90 by $\dot{u}$. This procedure yields 173 and thus proves the energy-dissipation balance to hold for a.e. $t \in[0, \mathrm{~T})$.
Proof of Theorem6.1 Item 3: Regularity \& energy-dissipation balance 9d] for all $t \in[0, \mathrm{~T}$ ), and Item 4: Improved convergence 129. For the regularity statements 77 for the displacements we point to Section 5.2.2 where assertion was obtained based on the convergence results $76 \mathrm{a}-76 \mathrm{c}$ and a priori bound 48 d in $L^{2}\left(0, \mathrm{~T} ; \mathbf{U}^{*}\right)$. Similary, also the regularity $z \in H^{1}\left(0, \mathrm{~T} ; L^{2}(\Omega)\right) \cap L^{\infty}(0, \mathrm{~T} ; \mathbf{X})$ in [128 is a direct consequence of convergence results 766](76h) together with the weak $H^{1}\left(0, \mathrm{~T} ; \mathbf{Z}_{M}\right)$-convergence 127. We now discuss the last statement of 128, i.e., $z \in$ $C^{0}([0, \mathrm{~T}) ; \mathbf{X})$. For this, we consult Theorem 6.2 The above discussed regularity for $u$ provides assumption A3). We further note that assumption $\widetilde{A 1}$ ) is satisfied by (9a) with the closed, convex set

$$
\mathbf{K}(t):=\{\eta \in \mathbf{Y},-1 \leq \eta \leq 0 \text { a.e. in } \Omega\} \text { for all } t \in[0, \mathbf{T}] \backslash \widetilde{N} .
$$

Similarly, also the upper energy dissipation estimate (133) claimed in assumption $\widetilde{A 2}$ ) is valid on $[0, \mathrm{~T}] \backslash \widetilde{N}$ thanks to (9d).
Moreover, the weak momentum balance (9C holds true for all $t \in[0, \mathrm{~T}]$ and thus yields A9). As already checked in Section [5.3. in view of Lemma 5.4 also the properties claimed in assumptions A4)-A8) and A10) apply to system $\left(\mathbf{U}, \mathbf{W}, \mathbf{Z}_{M}, \mathcal{V}, \mathcal{K}, \mathcal{R}_{M}, \mathcal{E}\right)$. Thus, in view of Lemma 5.4 all statements of Theorem 6.2 are valid for

$$
\left(\mathbf{U}, \mathbf{W}, \mathbf{Z}_{M}, \mathcal{V}, \mathcal{K}, \mathcal{R}_{M}, \mathcal{E}\right) .
$$

In particular, estimates (134) and 139 are valid with $\alpha=2, \mathbf{S}=\mathbf{X}$, and $\beta_{u}=1$. Since the dissipation potential $\mathcal{R}_{M}$ encodes a unidirectionality condition we conclude that $z \in C^{0}((0, \mathrm{~T}) ; \mathbf{X})$ by Theorem 6.2. The continuity in $t=0$ stems
from the fact that $0 \in[0, \mathrm{~T}] \backslash \widetilde{N}$ by assumption so that one can deduce continuity from the right following the lines of the proof of Items 5 and 6 . Now, by the continuity properties of $(u, z) \in C([0, \mathrm{~T}] ; \mathbf{U}) \times C([0, \mathrm{~T}) ; \mathbf{X})$ we see that the validity of the energy balance can be carried over from $[0, \mathrm{~T}] \backslash \widetilde{N}$ to all of $[0, \mathrm{~T})$. We summarize these results in the following

Corollary 6.4. Let the assumptions of Theorem 6.1] be satisfied and let the one-sided variational inequality (9a) hold true for the initial datum $\left(u_{0}, z_{0}\right)$. Then system $\left(\mathbf{U}, \mathbf{W}, \mathbf{Z}_{M}, \mathcal{V}, \mathcal{K}, \mathcal{R}_{M}, \mathcal{E}\right)$ complies with the assumptions $\left.A 1\right)$, A2), A3)A10) of Theorem 6.2 Hence, a pair $(u, z)$ obtained by convergences 76 is continuous with respect to time, in particular $(u, z) \in C([0, \mathrm{~T}] ; \mathbf{U}) \times C([0, \mathrm{~T}) ; \mathbf{X})$, and it complies with the energy dissipation balance [9d] for all $t \in[0, \mathrm{~T})$.

Based on the energy dissipation balance (9d) also the improved, strong convergence statements 129 can be concluded for all $t \in[0, \mathrm{~T})$ by repeating the arguments of Section 5.4
